I'll have to hand it to Uniden on their TrunkTrackers. The TT radios seem to be a fair mix of sizzle and steak, and they certainly do track the Motorola trunked systems. The BC-895XLT is computer controllable though Uniden doesn't support it, but I hear that 3rd parties are offering control software for it. Try this site:

http://www.autowinnet.com/freetrack.html

Basically, I'm not sold on this first generation of TrunkTrackers, despite the fact that they work and the public seems to have accepted them. I'll tip my hat, that's for sure, but I'm all for waiting to see what GRE-Japan comes up with. And we all know that "Version 1.0" of anything these days isn't the best that can be done. So I am waiting for the competition to gear up and/or for the 2nd generation of TrunkTrackers to come.

Someone has to buy into the first generations of new stuff. If you are so disposed, you won't get any argument from me. If you have a conservative "wait and see" attitude, you'll find me in your company.

Besides, I've found a way to "track the trunks" with a PRO-2004. PRO-2005, or PRO-2006, and TrunkFollow to beat the tar out of those TrunkTrackers, so pardon me for my lack of interest in Uniden's glitz'n'glitter.

For alternative methods of TrunkTracking, see:

http://ourworld.compuserve.com/homepages/bcheek/trunk.htm

AOR SCANNERS
============

AOR appears to not want to sell very many scanners in the USA. They have a yo-yo, switchy-swatchy pattern to their marketing and technical support. Their service manuals are both expensive and deplorable. AOR seems to serve a cultist, elitist, niche scanning community. Despite that their top of the line radios might well be second to none, I just don't support them.

If you have an AOR scanner and like it, I understand why. But you are a minority and AOR apparently doesn't want to do anything about it. I prefer to serve the majority, and so there is little more I can say about AOR scanners.

NEW PLAYERS IN THE SCANNER GAME
===============================

Relm and Sony are new players on the scanner scene. I don't know anything about these rigs yet; the Sony is much too new, and the Relm just doesn't have much of a market penetration yet. People say it's a good radio; maybe they're right, and maybe they're just defending the wisdom of their purchase. I think both are doomed to bit-player and niche status, but time will tell.

Meanwhile, with rare exception, I give my stamp of recommendation only to those radios that have withstood the test of time. The johnny-come-lately's may well be good scanners, but if that's true, then they will pass the test of time. AOR's AR-8000 is one such example. It's been around for some time and continues to do well despite more advanced models recently introduced.

YUPITERU SCANNERS
=================

It is illegal to import "Yupi" scanners into the USA, because they are not certified by the FCC for sale here. Furthermore, Yupiteru seems to not give a whit about the US market, so why should I give a hoot about them? There is also the question about sending good USA money to markets that do not return some benefits to our community.

Not only that, but service and support for Yupiteru radios are either nonexistent or at best, 3000 miles away. However, you can't get a service manual for

these scanners. You buy a Yupi and you risk running afoul of the law; as well as having dead meat on your hands should the unit ever fail.

Some people claim the Yupi radios are the best they've ever used. I hear little of anything bad about them. So the issues you have to deal with are patriotic ones, and those of service and support, and last, but not least, legal issues. So far, no one's been nailed for importing a Yupi scanner, but somewhere, someday, someone's going to be the first. Could it be you?

WORLD CLASS RADIOS
==========

There is a class of radio, not properly called a scanner, but without a name or a home anywhere else. I call them "world class radios" for lack of a better term. These include wide coverage receivers from Icom, Kenwood, and Yaesu.

Kenwood and Yaesu seem to have slithered out of this market realm, leaving Icom pretty much uncontested at this time. Kenwood's RZ-1 and Yaesu's FRG-9600 are much too old to be real competition now, but these are classics, and if you can snag one cheap, you may have a deal that's worth it.

Icom has a number of entries in this class, including the R-9000, R-7000, R-7100, R-10, R-1, etc. I don't count these rigs in my recommended lists because they really don't fill the definition of "scanner" in the important sense of the word, and their cost is way out of proportion to scanners as we know them. Most of these rigs certainly qualify as "great" radios, but they are not scanners.

COMPUTER-BASED RADIOS
==========

A new class of radio has recently emerged....computer-based receivers, of which there are two: Icom's PCR-1000 and several class acts from WiNRADiO. This class of radio is characterized by their total worthlessness without a computer. These radios depend on a computer as an integral part of the operation.

Several new and upgraded versions of WiNRADiO are out now. Icom apparently isn't going to announce anything new until 1999

The PCR-1000 follows Icom's tradition of speed. If it weren't so slow, it would have no speed at all. It's

slower than a slug. But it does go portable by virtue of operation and control from an RS-232 serial port. And it does have some impressive technical specs for its coverage of LF into UHF. A little pricey, the PCR-1000 has made its mark and its loyal users appear to be satisfied with it in most respects aside from speed (or the lack thereof...)

The WiNRADiOs cruise at 50-cps, and along with their standard RF Spectrum Scope and optional Digital Suite, is probably the better buy at a price significantly lower than the PCR-1000, and with a very powerful control program that's regularly updated and released FREE to downloaders.

The WR-1000i covers 500 kHz to 1300 MHz, less cellular, but there are ways to deal with that. I can't tell you how, but if you look around, you should discover it.

The specs for the Icom PCR-1000 and WiNRADiOs are easily examined at the companies' Web sites, so I'll dispense with pitting one against the other. Both are great radios, but if you are undecided, you really need to do some homework and not take anyone's word for validating your decision. The Icom loyalists are too anxious to defend their choices while WiNRADiO just doesn't have a lot of market penetration yet.

Still, my choice is for the WiNRADiO, maybe because the hardware and software are undergoing constant upward revision and the company is very responsive to its customers. Just send them an e-mail and see for yourself. Then send Icom an e-mail...if you can.

WiNRADiO has a high-end model, the WR-3000x, that isn't certified for sale in the USA. That, and its $2000 price tag make it pointless to discuss it here, but some people have come by one and speak highly of its awesome capabilities, including visual DSP!

SUMMARY: As you can see, I really can't recommend a "best radio for the money". I have my preferences, and I told you about them. Take 'em with a grain of salt, or take 'em to the bank, I don't care. What matters more is that you be exposed to a diversity of thought and opinion. I am not a "company man" who minces words and wonders why we all can't get along. I deal in straight shooting and am happy to leave it to future generations to figure out why we all can't get along. All I know is that we don't, and I'm not going to lose any sleep over it.

You can try to understand the differences between the various classes of radios and even the differences between manufacturers before choosing the radio of your dreams. All too often, the best today is not the best tomorrow, or the best up front is not the best overall. Maybe there is no single "best". For a fact, many scannists nowadays own and operate two or more radios.

One thing to keep in mind...or get in mind....is that the entire face and nature of radio are changing, from the politics to the technology to the very content. What was good for and applied to radio of yesteryear is not good for or applicable to radio of tomorrow. Change is apparent everywhere. Be aware of those changes and learn how to cope with them and how to go with the flow.

There is less to listen to these days and I don't see that trend changing any time soon. It's only going to get "worse" as more and more radio services see the economics and privacy of cellular, PCS, and other means of private and/or digital communications.

But these very changes mean new opportunities in the offing. One example is how for many years, it took an expensive, sophisticated 3rd party instrument to decode RTTY, FAX, and CW. Now a couple bucks worth of parts and some free software do all that and much more. See my Scanner Data Decoder FAQ (SCANDATA.FAQ.) There may be less to listen to, but there sure is more to decode.

==========

That's it for now. I will keep this FAQ updated. If you see things that need to be added to it, by all means, let me know. If this FAQ fails to address your question(s), then hit me with 'em again, but be specific. And be detailed with symptoms and observations if you need tech support on mods or troubleshooting and diagnosis. Use e-mail.

> up to date would be appreciated. Thanks!

MS Access is among the best of the best, and it will
do what you want by either of at least two methods:

1. Change the FREQUENCY field to text. Then it
will take as many leading or trailing zeros as
you want.

Even though frequency is a number, it really doesn't
matter if you set it to "text", and it behaves
better if you do. The only drawback to this is that
you can't do math on a text field. If that's not
important, then "text" is the best setting. Otherwise
see (2) below if you want to keep it a number.

2. Go to the DESIGN VIEW of your Table, and highlight
the FREQUENCY field. Down in the PROPERTIES section,
set these parameters:

A. Field Size: DOUBLE
B. Format: FIXED
C. Decimal Places: 5 (or whatever you want)

I regularly read that site to see if there is anything new
(there isn't, including his not-yet-posted listing of me in
the "Lawyers and Law" section which I submitted to him over 2
years ago).

From what I make of his postings, he got the association to at
least a standstill if not backed down based on threats of pure
bluff. As I indicated, the "free speech" approach is one that
the courts have not supported. The association's lawyers
probably didn't have clue one about this specialized facet of
the law and as such caved in. Had they been comm lawyers as
well, I have a feeling that the situation would have been
different. Or the association didn't want to fund the battle.
A lot of them want the quick kill or they go away.

IN any event, good for Don that he got to that point.

Of course that was three years ago. I wonder what the current
status of the matter is.

> can't very well use the "aesthetic arguement anymore.

Thet sure can - the law FORCES them to ignore it for TV/video
antennas but not for ham/CB/commercial antennas. Of course, I
feel that the aesthetic argument is a stupid one, but it's
rasied all the time.

> > The FCC has been reluctant to impose any more antenna
> > preemptions unless there is a Congressional mandate to do so.

> Understood, but since this creates loopholes, a clever attorney should
> be able to utilize them in some fashion.

There is no loophole. The "can" and "can't" situation is
clear. You are right, though, there are attorneys who will try
to create loopholes for their use, but they are not the
knowledgeable communications attorneys who see the big picture.

> > Unless one can show an improper personal agenda or so-called

> Again a double standard. What you're in essence saying here, is
> that if I'm a "recognized minority", and every wrong done to me can
> be spin doctored into a case of race or gender discrimination, then
> I have a case?

You missed the point. IF you are "selected" for enforcement
BECAUSE of some improper factor not related to the proscribed
behavior, you can claim "improper sselective enforcement".

Example: Five cars are speeding. Your red sports car is pulled
over. No selective enforcement - driving a red car makes you
unlucky but not "discriominated against". If all cars are
plain cars and the Black driver is pulled over, a case of
"selective enforcement" may be made IF he can show that he was
pulled over for being Black, not because he was speeding.

> And if my "recongnized minority" neighbor, is successful
> in overturning a restriction, then why can't I use his precidence
> to elicit my own action?

You can raise the issue. Whether a court would accept is is
open to speculation.

> What about "ham discrimination"?

Been goinmg on for decades. We hams have gotta get past that
point.

> > How can you say that there's nothing wrong with "selective enforcement"?

We discuss this for hours in law enforcment managment training.
In the raw sense, "selective enforcement" per se, where one
person gets nailed for doing something and another person does
not, has many facets - "setting an example", "the luck of the
draw", limited resources, permissible exercise of discretion on
the part of the department...as long as it doesn;t involve
"statutory discrimination", it's hard to build a case on it.

The old saw "if you can't do the time don't do the crime"
applies.

> Rules are meant to be universal, they should apply equally to everybody.

They do. But just as in Don's case, sometimes you have to have
a good bluff to get them to be applied the way YOU want them to.

5407. PC895 Update

Newsgroup: rec.radio.scanner
Date: 1998-11-20 00:00:00 UTC
From: Phil Smalley <ziggy7445@yahoo.com>
Message-ID: <734g6j$o3f$1@phxtst22.phx1.aro.allied.com>
Source record: 137475

Just wanted to keep you folks posted on my progress to date. I'll post a note up here about once a week as we move closer to our next release date.

Last night I put the finishing touches on the new communications routines, using the official Uniden specs as a reference, and I'm really excited about this one. For starters, remember the annoying delays I had to build in to keep your PC from flooding the scanner? Forget 'em. They're gone. This thing runs like greased lightning now. Previous users are going to notice a HUGE difference. What's more, I am now able to pull back the return codes without any errors. This will run just as good on an old 486 as it will on a 400MHz PII. Also, users will no longer need to specify the location of the scanner. PC895 ver 3 will find it automatically.

The interface got a drastic facelift as well. I got rid of the fancy buttons; they looked good but they were flaky and added unnecessary bulk to the program. And remember that clumsy database interface? History. The new version will store data in a simple to use, Excel style grid. Plus, all the features will be in tabs at the bottom of the window, instead of several separate windows. One of the tabs will have a Main Viewer, which will show all the data fields not shown on the scanner itself, such as agency, designation, scanlist, etc.

Next up is the database engine. Say goodbye to Scanlist.mdb.99% of the bug reports I got on version 2 had to do with that lousy file, so it's outta here. This guy is going to use standard APF files directly for conventional data, and comma delimited APF style files will hold trunked data. Version 2 users can export their data to APF files and then use them with version 3. What's more, you will now be able to upload all 300 channels to the scanner at once, instead of just 1 bank at a time (unless that's what you want to do, it'll be up to the user to decide)

Another thing I'm adding is something that Version 2 didn't get. I call it SoftScan, and what it basically does is manually tune the scanner to a given frequency without storing it in memory. This way you aren't limited to the stock 300 channels in conventional mode (sorry, but there just ain't no way to do this in trunked mode - think about it) You will be limited still - to 25000 channels per file, and up to 10 files open at a time. Hope that's enough, if it isn't then there's something deeply wrong with you! ;-) Lots of other scanning programs do this, and I should have implemented it from day one.

A professional version is also on the drawing board and this guy will do all of the above plus more. I won't list all the new features yet, but how would you like to be able to scan conventional and trunked frequencies together? How about on the fly DTMF decode? Priority TALKGROUPS as well as priority channels? Last Frequency Return? It's all very possible...

Of course, the professional version won't be free, but it will be cheap. I think $20+s&h is reasonable, but by all means let me know what you think. I will say that, this time around, I'm not going to use ANY other company to sell this. I will handle it myself, and I won't let the same fiasco happen again. If you are an ICP member, there will be a discount in it for you too. Bottom line: I'm not out to make a fortune on it, I have a day job that more than pays the bills, but sacrificing a month or more of my free time is worth something in return I think....

And of course, I'm taking any and all wish lists for it. Don't expect your scanner to jump off the shelf and fetch the paper, but I'm sure there are some PC895V2 users out there who can share their ideas with me. Don't be bashful, now, send 'em in! (or better yet, post them here)

That's it for now, if you need to download version 2 it's available at http://www.mghusa.com/scanner/pc895/ and I suspect version 3 will be available there as well (right Mike??? Email me, my yahoo account freaked out and I lost a bunch of messages, maybe yours?)

-Phil

Sorry, but the analogy you give is wrong.

A more correct analogy would be that your neighborhood has a common bundle of telephone circuits running through it. Instead of one monopoly telephone company, everyone hooks up their own phone to the common wires or hires someone to do it for them.

Your "problem" neighbor is properly wired into the telephone circuits.

You paid some incompetent, cutrate, installer to hook up your telephone. The installer did a poor job of installing your telephone and crossed your neighbor's wires with your wires such that when your "problem" neighbor uses his telephone, your poorly designed and installed telephone system malfunctions.

You ask your neighbor not to use his telephone because it interferes with your poorly designed equipment. He is not willing to give up his telephone because of your malfunctioning equipment.

He tells you that you should fix your telephone installation. Your installer is unwilling to fix the problems. You are unwilling to pay for a proper installation or unable to find a competent installer.

You decide that the proper thing for you to do is to hook up a tesla coil to your neighbor's telephone wires so that it jams his equipment and keeps him from using his telephone.

This assumes that the interference comes from someone using his legally allocated frequencies and power levels. If he's running equipment that is putting out signals on the wrong frequency or illegal power levels, change the faulty wiring job to his end.

The loud band analogy is different. Anyone with properly working hearing will hear the band. It's not a case where only those people with cheap or defective hearing hear the band. There is no selectivity where "properly working" ears don't hear the band and only "improperly working" ears hear the band.

I do understand your frustration. but if the radio operator is operating properly, the fault lies in your defective equipment, not on his end.

I often find that I am unable to listen to some radio signals I would like to listen to because of nearby properly operating, licensed radio transmitters such as TV stations, pager transmitters, etc. and the limitations of the radios I am using. I don't feel that these legal radio users should be forced off the air because of the limitations of my equipment.

I haven't considered going out and sabotaging their equipment just so I
can listen to some weak signal with the equipment I have.

5410. Images of cell-phones

Newsgroup: rec.radio.scanner
Date: 1998-11-20 00:00:00 UTC
From: hurst_m@hotmail.com
Message-ID: <734p6n$d1k$1@nnrp1.dejanews.com>
Source record: 137478

You are receiving "images" of the the cellular phone conversations. The SC150 is a double conversion radio, in which signals appear to be receivable both on the actual frequency and 21.4 or 21.6 Mhz higher. This effect is caused by the scanner's superheterdyne circuitry and is common in nearly all double -conversion scanners. Cellular phones in the US operate exclusively between 824-849 Mhz (phones) and 869-894 Mhz (towers).

Kathleen,

There is a health risk with high power RF fields which increases with power and frequency. Unless his radio station is very poorly designed, it probably does not post a risk to its operator. On the other hand, if he is running high power, he is required by the FCC to perform a survey of RF fields around any radiating elements (read : antenna). There are pre-defined limits for "uncontrolled" exposures (like you and your house). If his antenna is too close to your property so that unsafe RF fields exist, then you have grounds for action. Tables have been set up to aid in this determination. For high-power on the highest HF band (10m), uncontrolled RF exposure limits say that his radiating elements cannot be closer than some tens of feet from your property. Exact numbers can be determined based upon the tables.

Understandable voice signals coming through your appliances means that he is operating AM, not SSB like most modern amateurs on the HF bands. If that is the case, there is a good possibility that he is operating high-power CB, and not Ham gear. SSB signals sound like badly distorted audio.

Scott -

I posted a similar question about a week ago. I received many fine reports about the BCT-12; so many in fact I think I am going to make a purchase.

Perhaps you could do a search at: www.dejanews.com and retrieve the comments I recieved about this unit. I know I am sold.

Regards,

Dick

An interesting note on this...I went into a RS store to order the service manual for my PRO-90. The manager (a friend of mine) went to look up the price and part number in his catalog, and discovered that it is listed as "Restricted - not available for sale".

I wonder what is in the manual that they don't want us to see? The sevice manual for the newer 150 ch model (I don't recall the model number) IS available. *Interesting!*

>What system are you having this problem on?

It's a type 2 system. I'll import the system file..

```
UnNamed System
MAP=?????22??
OPTIONS=nVDXf
PLAN=8
v865.3625,23e,ffff
v865.6125,248,ffff
dv865.8375,251,ffff
v866.1125,25c,ffff
v866.6125,270,ffff
v866.8375,279,ffff
v867.1125,284,ffff
v867.3625,28e,ffff
v867.6125,298,ffff
dv867.8375,2a1,ffff
v868.1125,2ac,ffff
v868.3625,2b6,ffff
v868.6125,2c0,ffff
v866.1000,2d4,ffff
v866.3500,2de,ffff
v866.6000,2e8,ffff
```

When any transmission moves onto one of the last three frequencies my scanner doesn't pick it up. Yet when it moves back onto any one of the other frequencies i have no troubles receiving it. So I am assuming somehow trunker has incorrectly identified the last three frequencies. It's the same for any of the systems i've been able to pickup.

Hello,

I have just acquired a Bearcat CompuScan CP2100 computer controlled scanner. It is now setup to run on the Commodore 64 using SCANNER1 ver 1.0 software. My question is: Has anyone converted this Commodore program to an IBM format and rewired the interface cable. The original manual and ad cards say it will interface with just about any computer. But it seems Uniden stopped at the Commodore 64 which was popular at the time. (1984)

Please e-mail me with any response at noobody@aol.com

Thanks for your time.

I monitor the following:
Pro2004 .. Pro91 .. IC-R10 .. BC700A
Happy Scanning !

Well it's is not definitly known where the term HAM came from but the most widley accepted and told "story" is that three radio operators set up at very distant points to try out there home made long distance transmitters and recievers. Well to make it easier to communicate they decided to use thier initials in stead of thier names. I do not recall thier names but it turned out thier initials together spelled HAM.

Another point to make. I am not familiar with your particular radio but if it will monitor parts of the 800 mhz band then it can still listen to the trunk system. Put all of the frequencies of the group into the scanner and (usually once a day) lock out the DATA channel (you'll know this by the computer sounds) and unlock the DATA channel from yesterday. And you CANNOT run any stop delay.
When sitting at my computer/radio desk if I whish to monitor my local trunk system (Montgomery Co. PA) and other local stations not on the trunk I use my trunk traker in the "old fashion" mode. And when put side by side with my handheld trunk traker it recieves just about 99% of all transmissions.

I have the following cards for sale I do not want to trade as I do not collect baseball cards. All of the ones below are in VG+ to EX+ condition email if you need more info or scans.

dandeb11@earthlink.net

1958 topps
#
30a Hank Aaron
150 Mickey Mantle
246 Yankees team
270 Warren Spahn
307 Brook Robinson
310 Ernie Banks
320 whitey ford
370 yogi berra
377 braves team
400 nellie fox
433a pancho herrera error card
440 ed mathews
464 curtis flood
476 x2 stan musial AS
482 Ernie Banks AS
488 hank aaron AS

1959 topps
#
1 x2 ford frick comm. of baseball
8 phillies team
30 x2 nellie fox
150 stan musial
163 sandy koufax
270 gil hodges
322 harry hanebrink
336 billy loes
350 ernie banks
360 x4 al kaline
461 mickey mantle (42nd HR) (sold)
464 willie mays (catch)

1960 topps
#
1 early wynn
7 x2 mays/rigney
35 whitey ford

50 al kaline
73 x2 Bob Gibson
136 x3 Jim Kaat rc
148 Carl Yastrzemski rc
210 x2 Harmon Killebrew
250 x2 Stan Musial
295 Gil Hodges
300 Hank Aaron
305 Richie Ashburn
316 Willie Mccovey
326 x2 Bob Clemente
343 Sandy Koufax
350 Mickey Mantle

Not exactly the same, but....

The latest (??) issue of Monitoring Times has a very good article on listening to satellite phones. I don't think Motorola's are using the same system, but the article was a good one and it sounds interesting. I have been meaning to head back to the bookstore and pick up the issue. Worth checking out.

It's not really pretty, but I used a RatShack wire antenna tacked up around
the four corners of the ceiling in an apartment and it worked quite well.
rec.radio.shortwave would be a better place to ask, tho.

I think it's called Ontario scanner guide by Jim Garnett. If you go to
Atlantic ham radio on Wilson av. just west of Bathurst in Toronto they
will know what you are talking about.!
It's the only printed scanner book that is totally up to date on freq's
in Ontario and trunk tracker talkgroup ID'S.

It's official ! The Durham regional police service has awarded an $11,000,000 contract to Clearnet to provide a digital MIKE based radio and data system. The switch over date is set for April 1-99.

Initially it will be just the police that will be on the 32 site system, but you can bet any money that the fire dept's will join within a year as the new network will have plenty of bandwidth to accommodate new users.

Some police services choose to scramble the detective and surveillance channels for obvious reasons.
Durham has chosen to become a totally secretive police force. Keep in mind folks that the news media get 90% of their information from scanners and with scrambled radios the police have total control of the information and can basically deny any story or it's contents.

In contrast, Hamilton Wentworth police gave the local media their basic operational channel talk groups to thier trunk system. They figured that we will listen anyways and why not......

No many! Most of the Uniden stuff comes out of the US or goes through
the US were it's illegal. The Yupiteru scanners are available in Canada
and I know they cover cell.
Call Atlantic ham radio in Toronto at 416-636-3636, they can give you
more details and prices.

Hey Phil, how you doing?

Nothing wrong with Access, until you get a really large data file, then it turns into a snail. Working with PerCon's database files, 3,000,000+ records, is painfully slow with Access, lightning fast in FoxPro. I guess the other reason I like it is the *.DBF file format, and code that's similar to dBase, by old standby! Oops... showing my age now.

Actually, for ease of use, Microsoft Works, has a database that's REALLY nice and easy!

Take care,
Bill Crocker

Ooooh, TALK TOUGH, Casey Thrower!

Obviously, you don't know much about different cultures. Masa is Japanese.
"Ragheads" as you call them are primarily Arabic. Geez, you can't even use the
proper racial insult!

And this coming from someone who accuses others of being bigots, racists,
prejudiced, etc.

So what do we call a dimwitted redneck from Alabama with a weak signal? N4GKS.

>> It was always my impression that Uniden scanners were produced side-by-side
>> with the Radio Shack brand..... too many similarities in features for
>there
>> not to be *some* direct relation.

While it's true that Uniden does produce most (perhaps all right now) of RadioShack's scanners the RS models are produced to The Shack's specifications, and those could be better or worse than the specifications set for the Uniden models.
For example, most RS scanners require you to press a "program" key before entering a new frequency into a memory channel. Uniden scanners do not.
RadioShack has its own marketing department that draws up the feature they want in a radio, and sets the price they want to pay for it. It's up to Uniden to design the radio to meet those criteria. If they have to scrimp a little bit here and there to meet the price point, well so be it.
Another example. The case on my BC9000XLT is metal. The case on my RS Pro-2045 is plastic, even though they are very similar radios.

currently have ge delta 6m,2m and 70cm in car. have two spare 440 deltas. have scan control heads, radios are operational. tired of tightening plugs and so forth (car is four cyl and rattles plugs loose). deltas are 110w 120chnl rigs. they are currently programed with just about every repeater pair. setup comes with comspec external tone encoder.

swap for... icom ic18,ic28 and ic48 in operating condition. (these are small icom single band rigs that were made in the 80's) have ic38, want to have all the same rigs across the dash.

will consider other rigs such as kenwood providing all three (6m 2m and 70cm) are the same line.

any takers? email me. i WILL NOT split them up. they go as a package. the whole kit and kabutal, from my car to your house.

5479. HF Airband Log - 42 flights in 50 minutes!

Newsgroup: rec.radio.scanner
Date: 1998-11-21 00:00:00 UTC
From: Andre Brandao <l42303@alfa.ist.utl.pt>
Message-ID: <Pine.OSF.3.96.981121043257.22497E-100000@alfa.ist.utl.pt>
Source record: 137377

Hello

Weekend has arrived and there is time to listen to the airbands!
This time I listened to more than 40 flights in only 50 minutes: I
used three freqs (6628, 5616 and 5598KHz) worked by 4 Oceanic Centers (New
York, Gander, Shanwick and Santa Maria). Signals were always very strong.
The busiest freq was 5598 KHz.
The Screen Shot I made for this log includes a Vertical Window
display (shows the aircrafts by altitude and route) which shows the
extreme efficiency of the Control Centers in separating the flights.
It is available at:

http://www.geocities.com/SiliconValley/Lakes/9420/shotex18.gif

Really hope you enjoy this post. It is really very interesting
listen to the airbands specially in busy ones like the North Atlantic.

Best regards, Andre Brandao

I have a friend who has both the AR8000 and the AR8200. He feels that while the AR82K does have more features and is slightly easier to use than the AR8K the performance is pretty much the same as the AR8K, except on medium wave AM broadcast, and that's because of the plug in antenna included with the AR82K.
The 8200 also seems to be more ruggedly constructed than the 8000, and it's considerably more compact.

>Most Uniden-produced models are
>identical when sold by RS except for the >labeling on the cases.

Not hardly. There is no Uniden equivalent of the Pro-2045, for example, yet the radio was built by Uniden. There is no Uniden equivalent of the 150 channel handheld trunktracker, or the Pro-2050 base trunktracker, or the Pro-2048 200 channel base model. All are built by Uniden for RadioShack, to RS's specifications.
There have been relatively few Uniden/RadioShack clones where the radios were virtually identical. The Pro-90/BC235XLT is one, and the BC890XLT/Pro-2036 was another.
If you don't think there are differences go back and read Bob Parnass's review of the Pro-2045 in Monitoring Times. This radio is very similar to the 9000XLT, yet Bob found considerable differences.

>Any RS scanner with a 'program' key is most likely a GRE model, NOT Uniden.
>Uniden doesn't make THAT kind of a change just for RS.
>

Sorry, but that is BS. Look at the Uniden built mobile trunktracker. It has a "program" key. So does the 150 channel handheld trunktracker, the "race scanner," the 50 channel handheld, the 30 channel base station and the 200 channel base station. All of these are Uniden built. Just pull out your RS catalog and look closely. You'll see a "program" or "pgm" key on every one of them.

Do You remember any call signs, etc?
IOW did you hear anything like- AB4CDE ?

or was it like "That's a Big 10-4?
Ham stations use their call signs when beginning and ending a contact-
CB stations use a handle like BloJoe calling BloBob.

I never had anything like this when I was busted...

I have a van pull up, with the accompanying US Marshall, as well as a local Sherrif (I was in county jurisdiction). They came in the house, first looked at all the equipment, deemed it legal (nothing said Galaxy or other brands (I ran a Tram)), then put a small external coupler on the coax (like an inductive wattmeter) and keyed the mic. It told them that I was transmitting at 5 watts output carrier. Due to the fact that at the time of the radio being in production it was common to have a wattmeter, as well as the manual saying that you could mis-tune it for more power (actually, you where tuning it correctly), they let me get away with that., with the stipulation that I cut the power down a watt.

The VFO was not unlocked. They did ask about the car batteries on the floor, but I explained that they where for my car stereo amplifier, which was tucked away behind the bench.

After they left, I took one of my MTX 15 inch subwoofers out of the box the radio equipment was on, pulled the amp and modulator (both 12 volt) out and put them back in line. The marshall told my neighbor that had complained that I was in compliance with the law, and if he pulled my antenna down again (it was laying on the ground) that he could be charged with criminal mischief.

Here's another caveat about Copper Electronics: if you place an online order at Copper's web site, ask them to send you an email confirming that they have received your order and have entered the order into their processing system. The last time I placed an online order with Copper, the order was received but for one reason or another was never entered into their processing system. It took two emails and a phone call to finally get the item shipped out. The end result was that I waited four weeks to receive my order. Buyer beware. 73.

ok folks see if you can help a basic newbie with this one
I wish to be able to read the data signals that taxi companies send out
(with cutomer pick up information,times,ranks etc) in the 165,167 band.
I have a hand held scanner and can hear the data ok
now if I was ever able to get this these signals into my computer do you
think its plain text info that a bullitan board reader could read or would
you imagine its encoded ,are decoders freely avaiable? ,i beleive the
signals im interested in are sent and received using "auriga" hardware , i
would imagine auriga software
ok if it looks simple enough to "read" these signals or decode thses signals
how do I get them into my computer to read them
cheers for all your help
Paul

>I have a Pro-2006 that didn't respond to the "D-502/D-503" clip
>mod. Are there some newer scanners this will not work on? If so,
>what is the "new" procedure, if any? Does anyone know the serial
>number range that the d-502/d-503 mod doesn't work on?

I'm not aware of it not working on any 2006 produced, but in case you missed
anything obvious, here's the lowdown:
Did you hit the reset after you clipped the diodes?
Here's the mod from Grove Electronics:

824-851, 869-896 MHz Frequency Restoration
Tools Required: small Phillips screwdriver, small wire cutters.

Procedure: With the power cord unplugged, remove the two rear
cabinet screws holding the upper cover. Lift off the upper cover,
being careful not to stretch the speaker leads. Examine the inner,
right-hand-corner of the front panel to find two glass diodes, labelled
D503 (upper diode) and D502 (lower diode).
Using the clippers, very carefully snip the visible lead of the lower
diode (D502) at its bend and slightly separate the cut ends. If it is
ever necessary to send the radio back for warrenty repair, the diode
leads should be carefully resoldered.
Reassemble, plug in AC cord, turn on scanner, and press RESET.

Hope that helped.....

5504. Free owners manuals for your Bearcat scanners

Newsgroup: rec.radio.scanner
Date: 1998-11-22 00:00:00 UTC
From: Ken Ascher WB8LIT <cei@mediaone.net>
Message-ID: <3658C2F2.79DDAA1F@mediaone.net>
Source record: 137203

Because so many people buy previously owned Bearcat scanners
or sometimes misplace their owners manuals, as a service to
scanner owners, Communications Electronics has complete
scanner operations guides (owners manual) for our most popular models.

You can get your free copy on our fax-on-demand system
or on the web when you visit our web site at http://www.usascan.com.
We previously offered this service only to our government
accounts but currently the owners manuals for our most requested Bearcat
scanners are on-line in the public area of our web site.

For your free Bearcat Sportcat 150 owners manual, scroll down
until you see the picture of the Sportcat 150, then click on
"more information on the Uniden SC150". Then look for
"click here for free 35 page SC150 operation guide". Click on
this item. This should also launch Adobe Acrobat which is needed
to read this file. If you need a free copy of the Adobe Acrobat reader,
you can get this at http://www.adobe.com.

Once you open the owners manual file, you can view the entire
manual on-line or print it using the "print" button in the Adobe
Acrobat application. Do not use the normal print button in Netscape
as it seems to conflict with the Adobe Acrobat print application.
Since these owners manuals are in the Adobe PDF format, your
printed copies should look just like the original owners manual.

Communications Electronics wants to know if our scanner
documentation service and our other services are useful to
you. Please e-mail your ideas to cei@usascan.com.

Thanks for your comments and for purchasing Uniden products.

Happy scanning,

Ken Ascher WB8LIT
Chairman & CEO
Communications Electronics Inc.
Emergency Operations Center

I scan railroads, but in the interest of follwing trains for the purpose of photography. I sit trackside, listen to find out if something is comming or not. This is marginally successfull unless there is a track work crew in the area. Most railroads are CTC controlled, (Centeralized Traffic Control) and don't use radios much, unless there is a problem or they are switching. If there is trackwork in the area the trains have to ask permission past the workzone. This involves identifying what train they are. It can be interesting at times.

That was a PRO-91 @ RS for $165, not a PRO-90.
RS has been putting the 90 on sale for $199

There are a couple of places selling the BC235XLT
for $169 (saw 2 new in their boxes at a Hamfest
a couple of weeks ago, dealer selling them new).
CEI also sells them for this price but watch for their
"shipping fees".

Frequently. If you live in the Western US check out:

http://altamontpress.com/

They publish timetables. They have frequency listings for the various
railroads in the areas they cover. They also list mileage points for
stations, defect detectors and other points of interest.

Defect detectors monitor a train as it passes and look for defects. The
most useful thing about these is that they broadcast on the road frequency
when a train goes by. It gives you early warning and in some locations
can be used to know when to dash from one viewing location to another.
They are relatively low power output as they only need to reach the length
of a train.

Kalmbach publishes a book listing frequencies for most railroads. But
it's not very specific about locations.

bcheek@cts.com (Bill Cheek) wrote:

>The PRO-43 is capable of many mods and hacks, including continuous
>coverage from about 8 MHz to 1 GHz.

Why do you persist in misstating the facts?
Pro-43's will tune down to 500 KHz or less,
yet you claim a lower limit of 8 MHz.

I have no trouble getting a Buffalo AM station on 550 KHz
with my 43, and Boston's WBZ is nice and clear on 1030 KHz.

Never mind all the other stations it finds below 8 MHz -
every MW broadcaster within a few hundred miles, WWV, CHU,
WWCR, and about 50 unidentified SW stations broadcasting
in at least a dozen different languages.

Why doesn't your 43 perform this well?
You DO know that you should be trying this at _night_, right?

>The PRO-43A that came out around March-April of 1994 is neither
>cellular nor shortwave modifiable,

Wrong again. ALL Pro-43's can be modified for 500 KHz to 1 GHz
continuous coverage, but the 43A's require more effort.
For a scanner expert, you sure ain't.

>That's it for now. I will keep this FAQ updated.

I doubt it. Seems to me that if you can't do a mod,
you just treat it as if it doesn't exist.

...Andy

Here is a general list of frequencies you may want to try:
FBI-
163.425
167.2375
167.2875
167.3125
167.3375
167.3625
167.4125
167.4875
167.5625
ATF-
165.2875
Secret Service-
165.375
165.7875
164.4
164.65
DEA-
418.75
418.825
418.675
418.975
418.9
Customs-
165.2375
INS-
162.825
162.925
162.85
162.875
Protection Service-
415.2
417.2
Marshalls-
163.2
162.7125
163.8125
Also, search 137-144, 148-150.5, 162-174, and 406-420 for other federal
traffic.

Yes you can, however you will deplete the RF from the antenna by approximately 3 dB for each connected scanner. Also, the VSWR will get wacked when you do this, however VSWR effects on receivers is generally negligible.

If you had some extra cash around and wanted to do this properly, you could by a device called a "power divider" from a company such as Mini-Circuits. Around $160 should get you a decent one for the freq. range of most scanners.

What does this mean? You will only notice degradation on really weak signals.

One other thing. Scanners are notorious for leaking garbage from their tuning circuits, ("birdies") so you may find one scanner locking onto a birdie from the other. (this can happen even if they are not sharing an antenna!)

Good luck.

Source record: 137251

Unless you really need one and know EXACTLY what you are getting,
don't bother with a "preamp".

The mis-application of a signal amplifier can actually cause a
reduction in your station's RF collection capabilities. Signals which
have a low signal to noise ratio may disappear! Intermod may even
cover strong local signals!

Here's what to look for:

Small signal ability - Go for a low Noise Figure. If it claims less
than 1 dB, don't believe it. Good wide-band amplfiers achieve noise
figures around 3 to 6 dB. If your interests are mostly in the 800 Mhz
and up range, the amp simply MUST be installed right at the antenna.

Large signal ability (intermod resistance) - look for a 1 dB
compression point which is higher than your biggest signal. If you
don't have access to a spectrum analyzer, than you can guess based on
the closest or highest power transmitter in your area.

For most people, FM/TV transmitters represent the biggest signals from
the antenna (unless you live next door to a fire station/police
station, pager site, etc.) You can get radio/TV station coverage
maps from www.radiostation.com, or you can guess. For a moderate size
radio/TV market, a 1 dB compression point of at least +10 dBm should
be considered, although 0 dBm will be fine for most locations.

Finally, the famous IP3. Intermod products are created in RF
amplifiers when incoming signals blend together in a non-linear
fashion. As a rule, get an amp with the highest IP3 you can afford,
but don't settle for less than +20 dBm.

I can't emphasize this enough - THROW AWAY JUNK AMPLIFIERS!
Use good antennas and good coax, and preamplify only if there is some
target signal you just can't pull out any other way. (such as a
directional antenna).

solid state aircraft rig made by symetrics industries of satellite beach fl. rig is comprised of three slide out drawers in metal case. whole unit is about the size of 2 boxes of poptarts stacked laying on their sides. on the rear there are 3 conections, an so239, a bnc and a canon plug. the drawers are labeled tower, atu, and control panel. the tower and atu drawers seem to be the radios. they are two chnl each, have the folowing controls...power,squelch,chnl swtch, mute and volume.

the control panel unit has the following controls...master power, mic cnctr, hds cnctr, and a rotary knob labeled pushout,inter,cockpit,atu,tower,aux.

it seems that its two radios in one box that are independent from each other and can be controlled through the "control panel" drawer. the control panel drawer allowing you to select what you want to hear and were to hear it.

the guy i got it from said he powered it up but i never did anything with it so i cant guarantee it works, therefore it goes as is. i have no further info on this unit, no books.

$55 shpd

Got a dead or dying '51 that the 'Shack wants too much to fix????
Basically what I need is the entire display board, but will consider whole
units
in non-working order for spare parts. The keyword here is CHEAP!
E-mail with what you've got and what you want for it...

Just curious.....anybody scan railroads? Would appreciate some advice
if you do.

Thanks,

Dick

Just moved from the Midwest to Scottsdale.
Dug out the Bc200xlt w cellmod.
Anyone recommend a place to find the "local" Frequencies..
Anyone from this area read this group?
Thanks
Brandon

ok folks see if you can help a basic newbie with this one
I wish to be able to read the data signals that taxi companies send out
(with cutomer pick up information,times,ranks etc) in the 165,167 band.
I have a hand held scanner and can hear the data ok
now if I was ever able to get this these signals into my computer do you
think its plain text info that a bullitan board reader could read or would
you imagine its encoded ,are decoders freely avaiable? ,i beleive the
signals im interested in are sent and received using "auriga" hardware , i
would imagine auriga software
ok if it looks simple enough to "read" these signals or decode thses signals
how do I get them into my computer to read them
cheers for all your help
Paul

Why don't you crawl back into the hole you came out of.

This group was better when you were in exile.

>like new section? are they good? no? I had heard mixed reviews in the
>past...please help
>

Make sure that whatever you buy that you check out what the shipping charges
will be. When I bought from them, they really screwed me on the shipping. When
I asked what shipping would be, I was told "it's whatever UPS charges" and then
they went and ripped me off by nearly $20.

Digital is not necessarily scrambled. Scrambling certain sensitive communications is not equivalent to hiding everything. However, in monitors in Canada will have to get government-issued permits to own scanners that can demodulate digital signals, if such scanners ever get made.

Hi Brandon. Take a look at http://www.azstarnet.com/~danr for information on the Southwest Frequency Directory, Arizona's scanner book. You can pick up a copy at Ham Radio Outlet on Dunlap, either of the Spy Headquarters stores, Bronco One Communications, Apollo Communications, and a few others.

Also, look at http://www.axtek.com/n7qyk/icp/ for Information on Arizona's scanner "club" and notification system, Incident Command Page.

5553. TRADE: BC895XLT For PRO-2035

Newsgroup: rec.radio.scanner
Date: 1998-11-22 00:00:00 UTC
From: Tony Heatwole <heatwole@shell.clark.net>
Message-ID: <739eof$aq0$3@callisto.clark.net>
Source record: 137271

Hello. I would like to trade my BC895XLT for a clean PRO-2035. All I require is that the PRO-2035 works 100%, is at least 7/10 physically, comes with the manual, and comes with some type of power cord. My BC895 has no mods, has never been mobile, and I'm a non-smoker. It works 100%, and is a 9.5 cosmetically. The serial number is 75006197. Let me know if your interested.

The BC895 comes with all of the following:
-Mobile Mounting Bracket W/Box, Base Mounting Stand
-Original Box And Packaging
-AC Wall Adapter, Cigarette Lighter Adapter
-Telescopic Indoor Antenna
-Original Manual And 2 Frequency Guides

The BC895 is equipped with:
-Built In CTCSS, Hyperscan
-VFO Control, 300 Channels
-Bar Graph Signal Meter, WX Alert
-Trunktracking, Data Skip
-RS-232 Computer Control Jack

I don't think anyone has stopped to think
thats this is all going to be irrelivant in a short while anyway.
Your too worried about no-code hams and the scanner law that you haven't even
thought about the ARRL proposal.
REMEMBER...our class is changing to
Class A,B,C, and D in the proposal to the
FCC and then there will be no need to
worry about whether the Scanner law
prohibits no-codes, novices, or everyone.
If Michagan is so tight about theit law and
the way it is Spelled out, soon no one will be
allowed to have one.

>transmitting equipment you like without a licence.

That's true, you just can't transmit.

However, there is also the related issue of
if I go to Radio Shack, buy a PRO 90, have
it on the front seat of my car in the box, in the
Radio Shack bag, with the receipt in the bag,
have I, thus, "equipped my vehicle with a
scanner" ??? If so, I am illegal (I have no lisence) just because I have a
scanner in my car, even if it is in the box. THAT'S not a
reasonable law for the people.

5560. NEW Radio Manager Mini 32 for Windows

Newsgroup: rec.radio.scanner
Date: 1998-11-22 00:00:00 UTC
From: Ben Saladino <bicycles@fastlane.net>
Message-ID: <2695E6DCC67225C1.E686D9AE3D470126.C5978C5D18F54B13@library-proxy.airnews.net>
Source record: 137278

Introducing Radio Manager Mini 32 for Windows
A control program for monitoring a single frequency with minimal affect on your computer system. It's very light at less than 400kb. Great for simply tuning in your favorite broadcast station, TV audio, etc. A great Startup program so your radio's primary controls are conveniently loaded with a very low impact on system resources.

Controls
AOR AR2700, AR3000, AR3000/A, & AR8000
Icom CI-V Compatible Receivers
Icom PCR-1000
OptoScan456/535
Uniden Bearcat BC895XLT

Features
Presets for 10 of your favorite frequencies
Presets for CB, TV, Weather, and Time Channels
Task Tray Icon to keep the screen clutter down. Also allows Mute and Port Opening/Closing from the Task Tray Icon.
Optionally keeps the PCR-1000 and some other radios going in remote mode, even when you close the program.
Close Port button allows other programs, MODEMs, etc. to use the com. port without shutting down Radio Manager Mini.

To try it out please visit http://www.interplaza.com/bensware/rmm32.htm
It's still somewhat in beta, and I need some input from folks with some radios that I don't have.

Thanks and Happing Monitoring!

If he was using a tubed transmitter or amplifier, with higher than rated
plate voltages, then yes, he very well could have been emitting damaging
X-Rays from his station.

Source record: 137282

Hi,

>I just bought a pro-2041. I've seen a few sites on the net that have software to program the scanner via a serial port. Can the serial port control do anything else besides load up freq's, like add delay, Lock out or change what memory it's tuned to.<

Nope, Radio Shack kept it simple and then bailed out. I'll never understand their logic.

The documentation I saw when the the Pro-64 first came out made me think Radio Shack was going to be jumping into computer capable radios, but shortly after the 64 and 2041 were introduced, Radio Shack pulled the plug. Who knows why. There's certainly a market, but some how they don't recognize us. I live about 15 minutes away from Radio Shack in Fort Worth, and for that matter Uniden (who also is dragging their feet when it comes to giving us the features we want in scanners), but feel like we're lightyears apart.

Anyone from Radio Shack or Uniden online? Please jump in and prove me wrong. I'll gladly eat my words on this.

OK, someone else can have the soapbox now.<G>

Actually, you might be surprised to find out that while they were not happy about it, many police agencies who go digital, provide new agencies with a few units programmed onto all but their tactical channels. This is usually in response to the news media claiming their "right to know".

The new people today, are in many cases, NOT listening on scanners anymore.

Unfortunately, where this leave us, the general public??? Perhaps, (an it has been done on very few ooccasions) with a departments willful, and or legally enforced cooperation, they (the police) might allow a private individual the right to purchase and have rx only capabilities programmed in a digital 2-way. This is similar to what the news agencies get, except that many times to make the press put the new system in a favorable light, they generally provide the radios for free.

While may of us hobbiests may feel the public safety agencies are doing these things to thwart us, the truth is the FCC is really driving the moves to digital, and the fact the the scanner people get let out is simply a fringe benifit. The digital systems bring more than just privacy to the picture.

I like to listen as much as the next guy, but the reality is, unless the scanner users can unite as other special interest groups have done, and become a political presence with attorneys to argue for what may or may not be our rights, the days of listening to anything but taxi and shortwave are fading fast.

Food for thought!

Yes, including digital, assuming you are talking about "Cellular" telephones.

851-866 Land Mobile Radio (and Nextel Phones) Fixed End (Base Station Transmit) 25KHz Channel Spacing
866-869 Public Safety Radio Fixed End (Base Station Transmit) 12.5 KHz Channel Spacing
870-896 Cellular Telephone Fixed End (Base Station Transmit) 30KHz Channel Spacing

All mobile users for the above services transmit 45 MHz lower than the base station.

Primeco (PCS) and other similar new Digital PCS service carriers use the 1.8 - 2.0 GHz Band (formally and in some places still, point to point Microwave)

==========
Bill Cheek's Scanner Data Decoding
Frequently Asked Questions File
==========

Contents
=========

01: What is a 'Discriminator Output' and 'baseband audio'?
02: How can I find the Discriminator Output in my scanner?

03: How do I connect to the Discriminator Output?
04: How do I build a decoder interface circuit?
05: So how do I decode digital data from the airwaves?
06: How can I decode CTCSS, DPL, and DTMF from the airwaves?
07: Is it possible to "TrunkTrack" without a TrunkTracker?

Questions and Answers
==========
01: What is a 'Discriminator Output' and 'baseband audio'?

There is a growing interest in tapping the baseband audio out of various scanners for decoding of a variety of esoteric signals, including CTCSS, SCA, FSK, RTTY, FAX, Pager data, and trunked system control data, etc. By and large, such signals cannot be taken from TAPE REC jacks, headphone jacks, and EXT SPEAKER jacks because of the voice-band filters that are between the signal source and these output jacks.

Therefore, it is necessary to tap the "baseband audio" directly at the output of the discriminator chip for your scanner.

==========
02: How can I find the Discriminator Output in my scanner?

Table 1 shows a list of scanners, the discriminator chip(s) used in the scanner, circuit symbols of those chips, and the baseband audio (discriminator output) pin.

If your scanner isn't listed in Table 1, then refer to Table 2 to find its discriminator chip. The chips listed in Table 2 are all known Discriminators used in scanners and wide coverage receivers.

Between Tables 1 and 2, you should be able to find the discriminator and its output pin for any reasonably modern scanner.

Corrections and additions to these lists are requested. See my email and other addresses at the end of this file.

Once you locate the discriminator in your scanner, you have to make its output conveniently available on the exterior chassis, much like a headphone or tape recorder jack.

Figure 1 below shows how to determine the pin numbering system for most integrated circuits. Looking at the marking side of the chip, there is either a notch or nook at one end, and/or an embedded "dot" off to one side at one end. The notch, nook, or dot signifies the end that starts with Pin #1 and ends with whatever the highest numbered pin happens to be. Most IC's have 8, 14, 16, or 18 pins.

==========

03: How do I connect to the Discriminator Output?

HOOKUP PROCEDURE
==========

If you need the raw Discriminator baseband audio signal for external purposes, the best way to access it is via a jack installed in a convenient, unobtrusive location on the scanner.

1A BASE SCANNERS: Install an RCA or other jack in a desired place on the scanner's external case, typically the rear panel.

1B HANDHELD SCANNERS: If you can find the space, use a standard monaural 1/8" phone jack or a 3/32" mini phone jack. Some scanners are so cramped inside that even these won't fit. In that case a strip of 3 pinline sockets can be melted into the plastic case and wires soldered to the inside protrusions. The middle pinline socket is not connected to anything; it's just there as strength and support for the pinline plug you make, with the shield ground soldered to one end and the audio-center soldered to the other end:

GND---o o o---NFM DSCR (audio)

"Break-apart" pinline plugs/sockets are available from Mouser, DigiKey, and Hosfelt. These little puppies are good for a lot of hacker needs, so get a supply!

2. Connect the shell or outer frame part of the jack to scanner chassis ground. (Use one end socket for pinline connections)

3. Connect the (+) leg of a 2.2-uF to 4.7-uF tantalum capacitor to the Discriminator output Pin. (Capacitor should be tantalum, but can vary in value from 1.0-uF to 10-uF at a voltage rating of 16-35 vdc.)

4. Connect the center conductor of a shielded coax (RG-174, etc) or shielded mic cable to the (-) leg of the capacitor. NOTE: if the distance from the NFM tap to the jack is less than 3", then a single unshielded hookup wire will do fine.

5. Connect the shield of the cable at this end to a nearby
PCB ground trace or spot.

6. Connect the center conductor of the other end of this
cable (or single hookup wire) to the center or hot lug
of the jack.

7. Connect the shield of the cable at that end to the
ground lug of the jack.

8. Fabricate or buy a shielded patch cable with one end to
mate with the new jack on the rear of the scanner at
that end....and the other end to mate with whatever jack
is on the tape recorder, processor, decoder, or whatever
device is to be connected at the other end.

Now you are ready to connect a data decoder interface to the
baseband audio output jack.

==========
04: How do I build or acquire a decoder interface circuit?

If you want to decode trunk control, MDT, pager, fax or
other digital signals, you will need to build or buy a
simple Interface to go between the NFM Discriminator/
baseband audio of the scanner and a standard serial port on
the PC.

If you are not capable of building your own, or if you don't
have the time to mess with it, I sometimes can supply an
assembled/tested Decoder Interface, built inside a DB-25
shell and connector with a 2-to-3 ft shielded cable
terminated with an RCA plug, for US$35 plus $5 S&H domestic.
See my signature box at the end of this article.

The DB-25 shell connects directly to a DB-25 comport on the
PC, or, if your comports are DB-9's, you can get a
DB25-to-DB9 adapter for it. You should, however, be able to
make your own following the below instructions.

This is a tried and true Data Interface circuit that is good
for everything we've tried, including a wide variety of
scanners. External power is not required. This circuit
draws its power from the comport. It is similar to the
"Hamcomm" and "data slicer" interfaces, but is optimized for
more scanners and more applications.

SCANNER DATA DECODER INTERFACE SCHEMATIC DIAGRAM

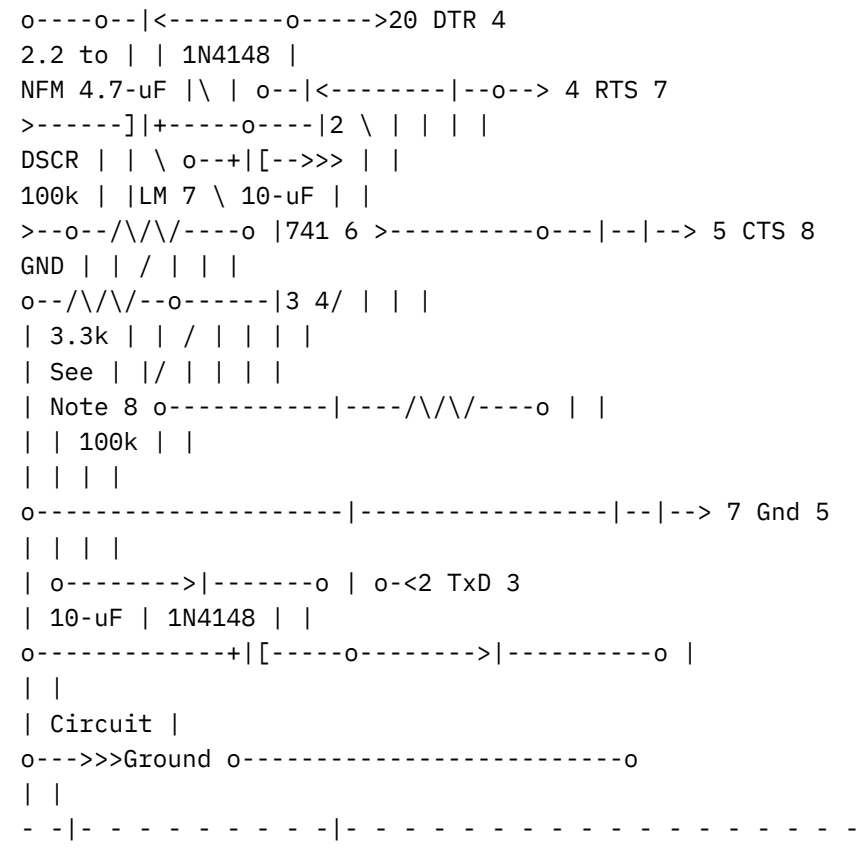
Scanner |<------circuit----------------->| DB25 DB9
==== ===



LEGEND:

```
|
--o-- = soldered connection/junction

--o = turn of the trace in the drawing
|

--|-- = crossover (no connection)
+|[ = capacitor, polarized (note the +)
>| = diode (anode->|-cathode)
|< = diode (cathode-|<-anode)
-/\/\/- = resistor
-->>> = ground
```

NOTES:

1. Use tantalum capacitors, +|[polarity as shown

2. Radio Shack's LM-741 op-amp works fine. Others might not!

3. Use 1/4 or 1/8 watt resistors to conserve space

4. Build circuit on a trimmed and fitted piece of perf board inside a DB-25 shell for max efficiency and space savings. DB-25 connects to PC's comport and a shielded cable from the scanner goes to the input; shield is ground and center is audio.

Printed plans available with precise schematics, drawings, perfboard layout, graphics, wiring, and solder points. Inquire: bcheek@cts.com

5. Many handheld scanners have no space to install a phone jack for the NFM Discriminator Output. For such tight spaces a strip of 3 pinline sockets can be melted into the plastic case and wires soldered to the inside protrusions. The middle pinline socket is not connected to anything; it's just there as strength and support for the pinline plug you make, with the shield ground soldered to one end and the audio-center soldered to the other end:

GND---o o o---NFM DSCR (audio)

6. For base scanners, install a female RCA jack on rear panel.

7. For handheld scanners where there is space, use a 3/32" mini or a 1/8" standard monaural phone plug.

8. 3.3k is an optimized value for most applications. If the baseband audio output is less than 400-mV AC, you can decrease the 3.3k resistor to 2.2k or even 1k if needed.

9. Connect the interface to a comport on the PC. Plug the input cable in to the scanner's NFM Discriminator Output Jack. Tune to a desired signal and run the decoder software of your choice.

10. If you are interested in using the "data decode" scanner to control or "TrunkFollow" a second scanner, then run a pair of wires off the Data Decoder Interface from unused TxD (Pin 2) and Ground (Pin 7) out the back of the circuit. This pair of wires will feed the RxD and Ground pins of another COMport on the PC.

==========
05: So how do I decode digital data from the airwaves?

First, you tap the Discriminator Output in your scanner. Then build the Decoder Interface and connect it to the Discriminator Output. Then connect the other side of the

Decoder Interface to a com/serial port on your PC.
Lastly, run the software that decodes the particular
type of signal that you want to decode.

In general, it takes different software for different
kinds of signals, and I can't possibly cover them all
here. I will suggest that you start out with a free
program called TRUNKER that decodes the control data of
Motorola trunking systems. This is one of the easiest
to set up and get working; therefore, it makes a good
test "platform" to prove up all your work before you
venture into bigger and better things. Motorola trunk
systems are fairly common now.

TRUNKER and a good set of documentation and limited
support for it can be found at the following Web Sites:

http://www.geocities.com/CapeCanaveral/Lab/1060/beta.htm

or

http://web2.airmail.net/lblant1/dfw/digital.htm

==========
06: How can I decode CTCSS, DPL, and DTMF from the airwaves?

That is strictly up to specialized hardware and/or
software that kind of goes beyond the scope of this FAQ.
Lots of software is out and about that will do it, and
there are even possibilities for "roll your own"
hardware decoders.

But the first thing you'll need is the "baseband audio"
output that is described in Questions/Answers #1-3
above. The Data Decoder Interface described in Q/A #4 is
good ONLY for trunking and pager types of data; not
CTCSS, DPL, and DTMF, unfortunately.

In fact, it takes specialized hardware and/or software
to decode each of CTCSS, DPL, and DTMF; and each is as
different as night and day.

Some scanners come equipped for CTCSS decoding, but most
do not. And none come equipped for DPL or DTMF that I
know of.

For more information about retrofitting CTCSS and DPL
decoders to your scanner, contact:

Communications Specialists, Inc.
426 West Taft Avenue
Orange, CA 92865-4296
(800) 854-0547 Fax (800) 850-0547
(714) 998-3021 Fax (714) 974-3420

WEB: http://www.com-spec.com/

For a low-cost "roll-your-own" DTMF Decoder (hardware) there is a nice project done up in great detail in one of the back issues of the monthly WORLD SCANNER REPORT newsletter, V3N10. Backissues are always available at a nominal cost. See:

ftp://ftp.cts.com/pub/bcheek/products/prodinfo.zip

There are other hardware and software solutions for decoding DTMF that I may include here later as I get the information verified and added.

The WiNRADiO Digital Suite is awesomely capable of decoding CTCSS and DTMF. See: http://www.winradio.com

For scanners in general, though, it all starts with a tap to the "baseband audio" point, so read over Q&A 1-3 above for the details.

==========
07: Is it possible to "TrunkTrack" without a TrunkTracker?

It didn't used to be, but times do change and YES! It is now possible to track the trunks without a 'real' TrunkTracker Scanner, and better, for that matter!!!

Like the other subjects in this FAQ, it all begins with a Data Decoder Interface. See Q&A #4 and Note 10 in that answer for the tiny extra addition you need to make to the Decoder Interface.

Next, you need a PRO-2004, PRO-2005, or PRO-2006 scanner, although we hope to add other scanners to the list in due time. For now, it's one of those three.

NOTE: It is possible to track the trunks with a AR-8000 and perhaps with one of the Opto Interfaces, but these are specialized situations where detailed info must be found elsewhere.

Then you need a CE-232 Scanner/Computer Interface (or its predecessor, the HB-232). You will also need the hot, new Windows program for the CE/HB-232 called Pro-Turbo.

Lastly, you need one fairly modern computer, Pentium 133 or better, for the easiest way to track the trunks, but there is another way almost as easy, if you have two computers, one a 486DX2/66 or better and the other, a PC-386 or better.

There are other requirements, too, but the above are the
main ones. It is beyond the scope of this FAQ to spell
out all the details, but the V8N9 issue of the monthly
World Scanner Report tells it all. You can order this
or any other back issue of the World Scanner Report
since Jan-91, including 6-mo and 1-yr subscriptions.

You can also download a more detailed text file on
TrunkFollowing with the PRO-2004/5/6 from my FTP site at:

ftp://ftp.cts.com/pub/bcheek/ce-232/trnkscan.txt

For more information on the Pro-Turbo software for the
HB/CE-232, contact:

Paul E. Turton
RR # 3; Wainfleet, Ontario Canada L0S 1V0
E-mail: pturton@iaw.on.ca or jabba@iaw.on.ca
Web: http://www.iaw.on.ca/~jabba/pro-turbo.htm

For more information on the CE-232 Interface, you can
download a file called PRODINFO.ZIP from:

ftp://ftp.cts.com/pub/bcheek/products

or you can view and download all the individual files
from the \CE-232 directory. Or, you can ask for it as
an e-mail file attachment from: bcheek@cts.com

or see the information in my signature box below.

But yes, it is now possible to track the trunks without
a TrunkTracker scanner, and do it better than any of the
"real" TrunkTracker scanners! The cost can be a lot
less than the cost of a real TrunkTracker, too. The cost
largely depends on what you already have, or can
scrounge up, but at worst, it's well within the budget
of many scannists.

==
That's it for now. I will keep this FAQ updated. If you
see things that need to be added to it, by all means, let me
know. If this FAQ fails to address your question(s), then
hit me with 'em again, but be specific. And be detailed
with symptoms and observations if you need tech support on
mods or troubleshooting and diagnosis. Use e-mail.

Alan:

If you were to listen to the tower frequency the phone is using, you would hear both sides of the conversation (usually). With an AOR and the Opto Scout, one might just be able to track the conversation; assuming they're in the same track as the cellular user.

Alan Graves wrote:

Jack wrote in message <3659e5f4.2635573@news.bell.net>...
>If you have not yet tried it, do it now!
>http://www.jps.net/gordone/mdt/
>
>That's right! You can now decode MDT with your soundcard
>+ an awesome windows interface.

I too have tried this program, last Friday. I really like the interface, and the ability to decode directly from the soundcard is very cool, but alas, the program sat there on my screen looking at me, and doing nothing. I tried the Mic input, the Line in input, every possible setting, searched for freq's, tried known frequencies, still the @#!! thing just sat there like a lump. (gloom)

So, my question is:

To those who got it working, what kind of soundcard do you have? Perhaps it's time to upgrade...

What settings worked for you? Maybe I'm missing one?

What frequencies do you monitor (perhaps the ones in my area are using the cursed 19.2 baud rate, although it *sounds* like MDC-4800 to me....) I know there are some nationwide ones out there, anybody have those handy?

If you live in the Phoenix area, then this information is even more relevant for me. If you live in Phoenix and use a BC895 for this then let me buy you lunch if you get this thing to work!

I know I've got the discriminator tap right because I can turn on my PC speakers and hear the audio coming thru clearly. The tap was installed per the instructions provided by Greg Knox. (Have you gotten this to work Greg?) I can also record the sound with Windows Sound Recorder, and play it back, no problem, nice and clear. I receive a strong signal (4 bars on the BC895's display), so I know that's not it. I'm installing it on a laptop today, and will try it tonight since it's built in sound card is newer than the one in my PC. (The laptop was to be the desired destination for this thing anyway, I think you can see where this is going...).

I mean it guys, I've tried everything under the sun. I read, re-read, and read again, the FAQ, the discriminator tap instructions, the Bible (hey, you never know), everything. I did everything by the numbers, but no data (not even in the Raw Data window! ACK!) I drew the line at diving into the source code, but (sigh) that's next.

Bottom line: If you got this thing to do more than sit there, PLEASE respond! I too want to revel in the glory of tasting the "forbidden fruit" that is MDT data! ;-)

You can reply to this newsgroup, or ziggy7445@yahoo.com or phillip.smalley@alliedsignal.com

Thank you , thank you, THANK YOU in advance for any help,
-Phil

Take a look at http://www.arrl.org/hamradio.html and
http://www.arrl.org/whyham.html

Do people use CB in rescue situations? Do CB radios have ranges of 30 miles or more under normal conditions? Do CB radio repeaters (very rare) have an autopatch? Can you talk with space shuttles? Can you watch SSTV? Can you do EME/satellite work? When using CB, the answer to every one of these is "No".

Can you prove amateur radio came from CB? I can prove otherwise: a "ham" is not just someone who uses a repeater/FM voice. Anyone with an amateur license could be called a "ham" - and some of them stay completely away from repeaters. I personally know three. For gosh sakes, CB and HAM don't even use the same transmission mode.

. . . Some things for you to ponder.

[lots more snipped]

Sounds like creative writing to me.

When it gets to the point that the US Marshal shows up,
warrant in hand, it is not for the purpose of testing
equipment, it is for the purpose of SEIZING the equipment
set forth on the face of the warrant. The inclusion of the
local law enforcement folks is pure courtesy - they do not
have to be there - and the function of the FCC agents is to
point out to the Deputy Marshals what equipment to seize.

The US Attorney, acting for the FCC, will not seek a warrant
from the U S District Court, nor will the Magistrate Judge sign
such a warrant, unless the FCC affidavit establishes reasonable
cause to believe that unauthorized equipment is being used/stored/sold
on the premises.

If, after arrival on scene. the seizable equipment is not in
plain sight, the "target" will be given ONE polite chance to
produce it. Otherwise, pursuant to the warrant, which is a
court order, the Marshals have full authority of the court to
search in every part of the premisies, opening drawers, boxes,
and other such places where such items may be hidden. It is
not unheard of for the Deputy Marshals to start ripping open
walls if they, the experts in finding hidden goods, feel that
it could be there. The occupant(s) of the premises will be
detained in one place while the search team goes room to room
making a thorough search. As we used to say: "if it moves we

shoot". FCC personnel are instructed specifically not to make the same sort of tests (power, frequency, etc) which would be made during a voluntary inspection.

How do I know the above? For over 25 years I was the Asset Seizure and Forfeiture specialist for FCC field operations, wrote and/or reviewed and approved all applications for warrants, and served as the on-scene supervisor in quite a number of such cases. We trained the Marshal Service in what to look for.

Good try.....

Hello everybody.

Please help. There is such transceiver: ADI SENDER-262 (printed)

Keys looks like:

```
A LAMP |---------------|
| DUP |
---- | CH 03 |
MON ---- | L S|
|---------------|

B PRI 0 PWR 1 2 3
C DUP D SCAN 4 5 6
* DIAL # MODE 7 8 9

+ selector + F-key
```

Same looking thing is ADI HT-16/36/46
ONLY INFO is found at http://leo.infoweb.co.za/KTRON/ktron4.html
(from K-Tron Electornics - South Africa)

Power On + DIAL -->

```
A____ here you can type whatever you want ;) (4 pos)
1____
2____
3____
4____
5____
C050,C080,C160,C200
d250,d450,d750,d850
AOFF,A001,A002,A003

Func+MODE ---> M1,M2,M3

M1 C000 -- type what you want 000-999,A,B,C blaaah ---
M2 C000
M3 C000 -- cannot modify ---
```

It MUST BE programmable from keyboard (100% sure) very simply ...
Please help!

Thank you,
Alex

The ones I was talking about are not like that at
all. Most of them have 2 to 4 sweep tubes in them.

But I also have one of the ones like you are
describing. It was sold by Allied Radio in the
late 60's and would take a 100MW walkie-talkie and
bost it up to 3 to 5 watts dead key peaking at 50
watts.

The Brand name was Lincoln, but I can't remember
the model number.

Black cat must have copied the design and called
it their JB-12 amplifier.

What literature I have would tend to reinforce
that theory, but they were legal for use on
Citizens band at one time, and most of them did
much, much, more than 25 watts!

Ohhhhh I want to believe that, but the Motorola emblem on Phoenix PD & FD's MDTs is casting some doubts.... however they *are* newer models and may use a different protocol. (That'd just figure, too, dammit..)

I went to the home page for this thing and listened to the .wav sample of MDC-4800 and I swear it sounds identical to what I'm trying to decode. But you may be right. I just wish I knew a local frequency that *is* MDC-4800 so I can be sure.

Anyone in Phoenix have the answers?

Hello All,
I am around electric vehicals when they are being serviced on a
regular basis and have noticed that the higher rated quality batteries
are heavier, I have applied this knowledge when buying alkaline
batteries for my Pro-51. I have found this to be correct when I
noticed the heaviest of the AA's to be the house brand at Pic N' Save
stores. At 89 cents for four they seem to outlast even the duracells.
'Just my observation....

Their is a 19.2k version.

>I went to the home page for this thing and listened to the .wav sample of
>MDC-4800 and I swear it sounds identical to what I'm trying to decode. But
>you may be right. I just wish I knew a local frequency that *is* MDC-4800 so

I noticed that the input level needs to be set to 20% on my awe64
soundcard for the decoder to work. I also noticed their is an invert
setting under options, might make it start working. If you have the
dos version and a slicer, if you just scan the band's you should
eventually find one. You will know for sure because something will
start happening immediately if you hit one. Might be a row of
asterisks if it needs to be inverted. With the soundcard version if
their is no activity it will appear that nothing is happening.

Hello,
I just installed an opto-456 board (full version) in My pro-2006. All went well and It seemed to be working OK with Listening Post. Then I unhooked the scanner from the PC and put it on another PC. The opto interface stopped working, the scanner display would come on like normal. I tried other pc's and even went back to the original machine... still dead. I pulled the board back out of the scanner and reinstalled it, no luck. I checked the cable and verified that the com port does indeed work. The scanner still works jusr fine as a stand alone but the board won't take control of it anymore.

Any ideas or suggestions?

Thanks & 73's
Mike Peaster

5606. MDT Freq's in Phoenix?

Newsgroup: rec.radio.scanner
Date: 1998-11-23 00:00:00 UTC
From: Phil Smalley <ziggy7445@yahoo.com>
Message-ID: <73ckii$b6u$1@phxtst22.phx1.aro.allied.com>
Source record: 137124

I'll try a little different approach on this one:

Has anyone in the Phoenix area decoded any MDT traffic? If so, what were the frequencies and what protocol did they use?(Looking for the MDC-4800 Protocol specifically) Additionally, did you have to use any special settings in the software before it would work? I'm trying to test out that new sound card MDT decoder program, and need a valid frequency to try. Any will work - police, fire, taxicabs, whatever. I just need to make sure that the frequency I'm using isn't the problem.

You can email me directly, or reply here.
Thanks,
-Phil

Hi Greg,

The Iridium Satellite Telephone system is a digital system. Scanning systems like Iridium are not possible with today's scanners.

It is also (in the case of my program and Freetracker) free. You forgot to mention that.

Also I'd like to add that I'm working on a faster version (much faster - no noticeable delay between the scanner and PC) and word has it that so is the maker of freetracker. Don't know about the others.

BTW: Is there a much better/faster program that you *do* use with your BC895? I'd like to take a look at it...

I gotta agree with you on this one - why can't Uniden/RS (I swear sometimes
that they're the same company) take a cue from AOR? I have yet to see a
radio come out of AOR that WASN'T computer programmable and DIDN'T have
every cutting edge feature known to man. Sure, these radios cost $600+ each,
but they have what I consider to be about $1200 worth of features! Well
worth the money and you can bet your boots that when Uncle Sam is done
playing with my money next year, and I get that refund check in the mail,
yours truly will have a brand spanking new AOR handheld to play with, and
there will be a program coming shortly thereafter to make that radio do
everything but dance a jig.

Anyone from Uniden care to elaborate on their plans for more PC controllable
radios? Or was the 895xlt just a passing fad? (Boy I hope not, folks...)
-Phil

5612. Local sherrif's band--how do I unscramble it?

Newsgroup: rec.radio.scanner
Date: 1998-11-23 00:00:00 UTC
From: kkhill@mcmsys.com
Message-ID: <W4l62.51$ri1.136202@WReNphoon2>
Source record: 137130

My wife and I own a Uniden 100 channel BC178XLT scanner.

Within the last couple of months, the sherrif's office has the ability to dispatch in %252522code%252522 (the dispatcher will say %252522switch to code%252522). When this happens, we still pick up the broadcast, but it is scrambled (sounding like badly tuned AM radio station).

As I've told my wife, where a signal or dispatch is scrambled, there is a method or device to unscramble it.

Any help would be greatly appreciated.

Please bear in mind that I'm not a scanning expert by any means, so don't get too technical on me.

Thanks---

David

Might try running the diagnostics on the floppy that came with the opto board. Look in the 0S456 subdirectory. Run the program and see if you can get the board to sing. You can toggle the comport, baud rate, freq, etc. Just a thought...

I have one and it seems to do a good job. I have it attached to an external window mount RS antenna 25-1300 MHz). It does not pick up the upper 800 MHz. In parts of the southeast US, the 800 MHz is leased from a 3rd party. The frequency they use is 850-865 or so.....

They're all modifiable for cellular. This is why Radio Shack had no choice but to discontinue this very popular (and profitable) scanner after the 1994 cellular ban took effect.

Can anyone confirm if ICOM released a new PCR-1000 (it would have been on or about Nov 1) that makes it 'impossible' to get cell (since previous models were less than difficult) to keep the FCC happy??

If they did does anyone know if there are any hardware changes?

If they did, and there are no hardware changes, has anyone tried to burn a new prom from the image on the older radios prom to make it function as an older radio (and has anyone had any success)??

Message-ID: <73cr4r$kt2$1@camelot.ccs.neu.edu>
Source record: 137140

Looking for specs for some PRO (RS/GRE) model scanners, specifically PRO-36, PRO-33, and PRO-31. Freq. range, #chans, banks, pri/dly/lo, all that (a la strongsignals.net).

I'm trying to tell whether the RCA RP-6100 scanner I have is a resell of a GRE model by comparing specs. I think it is one of those three.

Much obliged,
Kdt

Well I know I'm getting activity, I even recorded the sounds I was
receiving, and watched them in the meter in Sound Recorder. But the protocol
might be wrong.

I did some digging and found the frequency for the Nationwide Ardis Network
and I can receive it here in Phoenix. (For anyone interested, the frequency
is 855.8375) so I will try this one and see.

Thanks,
-Phil

>used with my BC895, but it is very nice program.
>
Yeah, I tried that one, but it didn't work very reliably for me. The other thing I didn't like about it was it left the scanner "dirty", that is, when you were done with the program it was left thinking you had entered a new frequency, and then you had to do some button pushing to get it back to normal again. I also found the interface to be clumsy. Then again, I was looking for more of a "virtual scanner" type of program, that you operated in the same manner as the radio itself. Failing to find one, I wrote PC895 instead. For those out there who use Scancat or a similer type of program however, Radiomax would be second nature.

It's all just a matter of preferences as to which program is right for you. (That holds true to just about anything in life)

As many you are aware, the service manual for the Pro-90 part #20-520 is restricted. I just called RS and asked to order the manual. I was told it was restricted. I asked why, and was told because, "of the mods that can be done to the radio". So, there you go. Start plugging away. It can be done. Only certified RS repair centers have the manual.

I bought one on eBay for <$190. The PRO-2042 can be modified.
This link sells new processors:

http://www.javiation.co.uk/

PRO-2035 "Full 800MHz Coverage" GRE-9410 CPU - Available
PRO-2042 "Full 800MHz Coverage" GRE-9621 CPU - No Stock

You can ask when they'll be back in stock or just settle for the
PRO-2035 replacement CPU.

Another option is to use an OS535 board and use the
"authorization code" to enable full coverage of the 800 MHz
band. Don't know if this will work on the OS535 interfaces
presently sold but it does work with ones sold as recently
as 3 months ago. ;-)

Have you tried using the Opto troubleshooting software that
was included with the board? If you need a copy of the test
utility (os456.zip), you can find it at this link:

http://www.optoelectronics.com/utility.htm

If that won't work, then Contact Optoelectronics. They are very
easy to work with and will test your board.

Good luck,

Robert

Gene, I am using a Gateway 400Mhz Pentium to operate the Sony. I have an external modem on Com Port 1 connected to Serial Port A (or 1).Have you tried to connect to another serial port so it doesn't conflict with modem? I initally tested the Sony on my old AT&T 133Mhz computer, and it worked perfectly. (Boy that sounds strange, the AT&T is only 3 years old and at the time was a "hot" computer".)

RadioShack had a choice, epoxy the circuit boards of scanners with 800 MHz coverage making a radio unrepairable or restricting public sale of the service manuals. This doesn't mean that "mods" such as cellular restoration are possible, but limiting the distribution of the service manuals reduces the chances of such a modification being created. Understand that it is illegal to monitor cellular phones and that it is also illegal for radio manufactures to make radios that are easily modifiable for cellular restoration. If a cellular restoration is discovered and posted on the Internet it will not be very long before that particular radio is recalled. So if you find a cell mod for the Pro-90 and you post it on the Internet it will probably be a matter of weeks that the radio will no longer be available at RadioShack. Of course this will cost RadioShack lots of money and will increase the price and reduce the quality of future radio models.

5644. FA: Trunk Tracking Scanner (PRO-91)- NO RESERVE!!

Newsgroup: rec.radio.scanner
Date: 1998-11-23 00:00:00 UTC
From: "Christopher Zeman, KB9RHA" <zman@###iwc.net>
Message-ID: <llq62.231$QC1.893@news6.ispnews.com>
Source record: 137162

Trunk Tracking Scanner (PRO-91)- NO RESERVE!!
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=44062103

Bidding starts at $125.00.
Auction ends 11/29/98 16:52:42 PST.

BRAND NEW IN BOX!!! NEVER OPENED!!! NO RESERVE!!!

Radio Shack PRO-91 Scanner (Handheld)

150- Channel Trunking Scanner
Follow conversations on most 800MHz trunked radio systems
used by police, fire, ambulance and other public services.

Triple-conversion circuitry virtually eliminates image-type
interference.

Service search for the following: police, fire, emergency,
air, marine, weather, and 5 Ham bands.

50-channel-per-second Hyperscan.

Limit search finds new and unlisted frequencies in a selected range.

Scan delay holds channels for two seconds after transmission so you
can hear more replies.

Q. What is the benefit of a trunking scanner? A. Computer-controlled
trunking systems, used in some areas
by groups such as police and fire departments, transmit
over a range of frequencies. The specific frequency used for
a call is selected at random by the computer. As a result
a reply to a call could be sent to a different channel. A
trunking scanner "follows" the conversation for you.

Q. What is the benefit of a triple-conversion scanner? A. Because of
the way frequencies are mixed in scanners,
occasionally
broadcast from one frequency is picked up on another. This is known
as an image. Triple-conversion circuitry virtually eliminates images,
resulting in less interference.

Buyer prepays $5.00 shipping and handling. Money orders only.

The other day I went over to Radio Shack and asked to have a look at the Trunk Tracker scanner. They gave me the $300 model. I have seen a trunk tracker advertised in the catalog for $169.99. I was wondering which scanner is a better one. I believe that my local police (Fairfax County, VA) are using a trunked system (can anyone verrify that)? I would like to be able to pick up both sides of the conversation. Currently, I can only hear periodic conversation and most of the time it isn't very clear.

Charlie

> Do people use CB in rescue situations?

Off-topic, but I have to reply. YES! I and people I know have used CB to contact people for help with broken-down or stuck cars, fires, dangerous road conditions, assaults, and many other situations... you don't have to talk to someone thirty miles away to find a person w/ a friggin' phone.

> Do CB radios have ranges of 30 miles or
> more under normal conditions? Do CB radio repeaters (very rare) have an
> autopatch? Can you talk with space shuttles? Can you watch SSTV? Can you do

> could be called a "ham" - and some of them stay completely away from
> repeaters. I personally know three. For gosh sakes, CB and HAM don't even use
> the same transmission mode.
>

So freakin' what? That does not take away from the usefulness of CB. Granted, there are a lot of problems w/ CB, but there are a lot of good operators - and good things that have come from it.
If you wish to continue this thread, you can via e-mail - or the proper newsgroup...

>
> . . . Some things for you to ponder.
> --
> RTF
> Ever stop to think and forget to start again?

Ponder this... stop being such a snob. CB isn't glitz and glamour and cw and licensing, but it is damn handy in a pinch. AND, I have talked way more than 30 miles on a CB. Try Texas, Florida, India, Great Britain, and others on SSB - granted, I was freebanding on some of these, but I have gone 1000+ miles on ch. 36-39 USB.
Get off your high horse...

Bring one to Memphis, I will scan it when I get home and ship it back to you
if you want to split the cost of shipping.

How's that?

Well, I have to put my 4 cents in here. I do volunteer work to help
find missing kids and 45 years ago, I ended up behind a probable
kidnapping suspect. To make a long story short, I following this guy
for about an hour (high speeds at times) and was using the CB to
communicate with a base. It went really well, except for the fact we
kept losing each other through bleed over. The big bummer was that
this went on for this long and went thru many towns. Several police
departments where attempting to join with no avail. All turned out ok
though. The child was ok, and the dirt bag who took her went to jail.
Some may say I could have kileed people by chasing them this long,
however, I feel that if I had not taken the action I did, the little
girl may of ended up in a ditch somewhere. The CB did dsave the night
in this case.

What? Doesn't the phone line get a shot of 120 volts every time the phone rings? I had the crap shocked out of me once twisting lines on a live phone line JUST when my brother-in-law decided to call. Wouldn't that voltage blow your receiver?

Source record: 137215

Just a passing thought. At flea markets I pass thru, I see many old commerical handie-talkies, pagers and the likes over the years. Today, I saw a old unit that my police department used many years ago. (Just the same model.) I remember I thought that was the coolest radio in the world. I would have done anything for it. But I settle for the scanner and at times I thought about purchasing marine, aircraft, CB, ham, and commerical, FRS, GMR, just for the hell of it. But what for, I can't transmit on it, and with a scanner, I can program it. AS I look at that old handie talkie, what really good can I do with it, besides take up space! Oh well, I just wanted to tell people my feelings and if you like to add to it, please do.

Back "in line" where?

Are you trying to imply that you used a car stereo amplifier (20Hz-
20Khz) to amplify your CB's (27Mhz) power output?

This is quite wrong. It will indeed cook your dinner. Mine is connected to my microwave oven and every time the scanner stops on a PF freq (with the appropriate CTCSS tone, of course), it sends a single to the oven which will nuke whatever is in it at the time. It's the only way I know to get a perfectly cooked potato.

Sounds like he is implying that the CB amp was hidden in a box that
the police didn't look in, thus exposing his poor neighbors to quite a
few more watts then the legal 4...Must have been alot more if they
came over and tore his antenna down!

Install is easy, getting it to work is another.
I have tried this program on a second computer - 75Mhz Pentium, lots of memory etc.
On this computer the program loads, but the radio never starts up. Com 1 is internal modem. It appears, the program is going to Com 1 and staying there.
The MANUAL states nothing about setting ports etc.
What kind of machines are you running this on? Processors, memory etc.
This is like my AOR8K and the programs for it wanting very specific things, or no go.
I am still looking for a program for the 895XLT
that will run without bombing out the radio or computer.
And yes, I did read the booklet that came with the radio. I am a Clinical Engineer W/15+yrs of exp. The first thing I do after opening the box is to read the manual, it helps avoid patient deaths/injuries and multimillion dollar lawsuits.
Thanks for the responses they are entertaining and informative.

I have found that putting a nail through the potatoes and connecting
them in series between a longwire antenna and ground during
thunderstorms works quite well. It gets the skins more crispy than a
microwave too!

Wow!

If the program can do that, I would have to agree, hats off to the programmer. I would also assume this person is keeping a low profile, as to decode MDC messages to the point of displaying them clearly on a screen, would take information not intended for public viewing. (Motorola proprietary) The lack of such information is what has been keeping MDTs (Motorola at least) from being truly readable via a decoder, for reasons already stated.

I would think the author should keep a low profile, as Motorola is known for aggressively prosecuting theft of intellectual rights. Case in point, a few years a go some guy in Michigan figured out how to unlock factory software programming functions for certain models of Motorola 2-ways, allowing users to "upgrade" lower tier models to high tier. He the proceeded to sell the information in a very public manner. Last I heard, this person is still in prison.

Don't know if it was the selling, or the telling, but I would not want to be in such a position. If this MDT stuff works as you state, it's probably in the author's best interest, to stay anonymous.

Very Cool Though!!

I don't think you needed to preach to the choir here.

There is only one securtity. That is the realization that there is
no security.

Period.

I have a cell phone. It is digital. It has encryption. But I STILL
won't trust it. There's always some hacker out there who will
say 'now THAT's a challenge!'

And, encryption itself is useless if you don't use it correctly. Like
the idiots who insist on having encryption available and only
use it once a month or so for 'sensitive' info. Hey, is someone
is sniffing, that's like shouting "Here's the file you need to bust
to get all the juicy bits!" Encryption is NOT secure. It just adds
effort. If you don't also hide the juicy bits in the noise, it's not
hardly effective (the encryption) at all. If you use encryption,
USE IT!! Use it for EVERYTHING! The grocery list, the
Christmas presents, the bitching letter to the cable company,
EVERYTHING. You have to hide the juicy bits in the noise!!

Newer Motorola MDT's are also capable of using RD-LAP 9600 and 19.2k which is a 4-level signal instead of the MDC-4800 which is a 2-level signal. 56k "flex" modems and newer "flex" pagers also use this signaling scheme. This may be what they are using.... Kurt

>> Pro-43's will tune down to 500 KHz or less,
>> yet you claim a lower limit of 8 MHz.

>I'd be mistating the FACTS if I "claimed" any lower.

>> I have no trouble getting a Buffalo AM station on 550 KHz
>> with my 43, and Boston's WBZ is nice and clear on 1030 KHz.

>Cool. So publish your method. Write it up so it
>can be tested and verified by outside parties.

>> Never mind all the other stations it finds below 8 MHz -
>> every MW broadcaster within a few hundred miles, WWV, CHU,
>> WWCR, and about 50 unidentified SW stations broadcasting
>> in at least a dozen different languages.

>Cool. So publish your method. Write it up so it
>can be tested and verified by outside parties.

Well Bill, since you're so keen on FACTS,
here are some FACTS straight from Deja News:

On 1998/06/10, you asked:

>Off the wall, did you ever do that shortwave mod to the
>PRO-43 and if so, did you do any front end rework?

On 1998/06/23, I replied:

>(sorry for the slow reply - just too damn busy!)

>As I posted many moons ago in SCANRADIO, I just bypassed the
>30-54 BPF and it works fine. I get many stations with a random
>wire antenna and an impedance matcher. Lots of different
>languages - Spanish, German, French, Chinese, and lots of
>programming - news, music, religious nuts, along with the highly
>entertaining programming of WWV and CHU. :)

>Certainly not as sensitive as a cheap SW receiver, but it is nice
>to pick up local AM broadcasters. Hell, even WBZ 1030 from
>Boston comes in nicely here in Toronto. I always wondered why
>the mod was touted as extending coverage down to 6 MHz, when
>reception is fine down to 0.5 MHz.

And you obviously saw that reply, since on 1998/06/23, you replied:

>> (sorry for the slow reply - just too damn busy!)

>Don't mention it. I only got around to wondering
>about you a day or two ago. If I didn't invent
>"busy", I sure put some flourishes and pleats
>on it.

Now Bill, just what is it you want me to "publish"?
Surely you know your way around the guts of a Pro-43
well enough to bypass the 30-54 BPF without more detail
from me. Even if you felt that my description was
too vague, you've had ages to ask for specifics.
But no, instead you take it upon yourself to do this
wonderful service and mislead people.

>> Why doesn't your 43 perform this well?

>I don't know right off. The front end bandpass
>filters and their cutoff frequencies certainly
>play a role. I haven't taken the time to design
>a bandpass filter for the lower end of the spectrum.

OK, I think we're getting to the bottom of this.
So when you write...

>The PRO-43 is capable of many mods and hacks, including continuous
>coverage from about 8 MHz to 1 GHz.

...you aren't writing facts at all. A factual report would
indicate that 8 MHz is the best that your limited efforts
to date have achieved, rather than implying that MW reception
is not on the list of the 43's many abilities.

Your misleading statement is even more inexcusable when
one considers that you have been informed on more than
one occasion that MW reception is an easily achieved goal.

As I said earlier, seems to me that if you can't do a mod,
you just treat it as if it doesn't exist.

...Andy

The problem with cellular monitoring laws.

Anybody who believes that they can transmit their telephone conversation over the air without encryption and not be overheard is rather naive; almost innocent. One can liken it to shouting across a crowded room and expect no one to hear. Yes a cellular phone is just that: a phone. But it is also a transceiver which means it broadcasts over the airwaves. Because of that second element, privacy can never be expected. Landline telephones are different - the wires they use are privately owned and thus disturbing them with the intent to eavesdrop is illegal. The airwaves are not privately owned (yet), just like the air around you is not privately owned. If that air carries the sound of my voice to you, then you may listen to it. In an analogous fashion, apply this to the airwaves.

In a crowded room, if one does not want their conversation to be understood by those around them, one speaks a different language or uses a "code" of some kind. On the airwaves, the same applies. This is why many agencies, including the government, encrypt their transmissions. They recognize that, no matter what, if they broadcast using conventional modulation techniques, there is little they can do to stop people from overhearing. Introduce encryption and suddenly no one knows what is being said. Simple huh?

The solution for the cellular industry: ENCRYPTION!. There is no other way without infringing on a citizen's rights (consult the Communications Act of 1934). Yes it will cost, however the cellular industry was foolish in the beginning to believe they could construct devices that transmit phone conversations over the air with no one overhearing. They made a mistake; most probably overlooking this in order to save some money. Well, now their customers are having privacy concerns, and rightfully so. I want my phone conversations to be private too which is why I never use cell phones, because laws or not, anyone can listen. Encryption is not hard to do, not hard to implement, not hard to use and can be very, VERY hard to break. What a novel idea to ensure privacy. But what is the problem? Cost. Think of all the things that would have to be "upgraded" to facilitate encryption: cell phones, cell sites, etc. The cost of this obviously is enough to steer the cellular industry to creating a lobbyist group (CTIA) to push our legislature into developing laws that protect their interests (since this route is cheaper). They are entitled to do so, however let's realize something: Encryption is the only way to secure a cellular phone call. Making the reception of a broadcast illegal won't stop people from listening and will have the further effect of misleading Joe/Jane Average Citizen to thinking no one would hear his/her call. Illegal or not, someone will always be listening. Any such laws to try and stop people from listening desecrates the Communications Act of 1934 and are nearly

unenforceable. Even making commercial devices with the capability of receiving the proper frequencies illegal won't do it. One can build such a device independently (remember Prohibition?). When laws become unenforceable, it is time to seek other methods. Again, there is only one sure solution: Encryption.

Think about a law such as the following:

"If someone states they do not want you to hear what they are saying when they are shouting to the person next to you and you do hear it, then you will spend 1 year in jail for hearing it."

Find me someone who agrees such a law is just. That's exactly the case here. A law against listening to a broadcast is foolish.

Understand completely. However, I wasn't particularly interested in the
modification of the unit making it capable of reading cell
transmissions.

I was aksing about other modifications such as:

1) extending batterly life
2) how to turn on the display for more than 15 seconds
3) how to set up the radio for factory frequency settings
4) were there any key combinations that resulted in other freq settings
5) what were the factory settings
6) how to increase the scan rate
7) any other tips/tricks for this rig

whtmtnman@pop.mpls.uswest.net writes

HI,

>I have just gotten the JAV 232 interface.Not being a
>computer wiz I guess I have to install a port and cable in
>the computer????Anybody help me on this??

The JAV-232 just plugs onto a free 9 Way serial port on the back of your
PC (COM1 perhaps). If this is being used by your mouse or other device
and you only have a free 25 way serial port you need a 9 Way -> 25 Way
adapter available from most Computer retails (RS, CompUSA, Staples etc).

If you are using the JAV-232 with something other than a AR8000 you will
need to make up a suitable lead to connect it to the JAV-232. Details
are in the manual supplied.

Hope this helps.

Cheers,

HI Guys,

Would like to hear any comments about the BC9000XLT good or bad. If it's a good one to get, where is a good place to get one at a fair price?

Thanks,
Dan

In article <72u86k$n23$1@nnrp1.dejanews.com>, researcher1@my-dejanews.com writes

Hi Peter,

>Has anybody evan heard of the Challenger DJ 200 scanner? if so any info (eg
>frequencies etc) much appreciated.
>

There was Black Jaguar BJ200 that also appeared with the "Challenger" badge.

16 Channels, AM/FM with coverage that went something like:

26 - 30MHz
66 - 88MHz
118 - 174MHz
210 - 260MHz
360 - 520MHz

You could usually program some frequencies outside these limits with reduced performance. Power was from an internal Nicad pack.

Hope that helps.
Cheers,

>Of course this will cost RadioShack lots of money
>and will increase the price and reduce the quality of future radio models.

When everybody goes digital trunk, and mostly secure digital trunk, Radio Shack digital trunking scanners will either be astronomical in price, or they are going to be worthless toys. Either way, Radio Shack is heading downhill in supplying DESIRABLE scanners to the scanning public (because of laws or falling behind technology) Public will start looking elsewhere for better performance than to wait for Radio Shack to catch up to digital trunk scanning.

Phil,

Motorola has at least 4 actively used MDT over the air protocols, and a couple of retired ones.

MDC600, No Longer Used for MDT

MDC1200, No Longer Used for MDT, but still around used primarily for call alerting and signalling on convetional.

MDC4800, Legacy Data Systems, Not a production protocol except for system add ons to legacy systems.

MMP4800, Legacy Data Systems (old MDI Protocol),Not a production protocol except for system add ons to legacy systems.

RD-LAP 9.6

RD-LAP 19.2

Most of these PC based decoders are for MDC4800. To date, it is the only known Motorola MDT protocol which has been "cracked/hacked".

It should also be noted, that even if you decode the data stream, what you will see on the screen is mostly header and other FEC info, with an occasional glips of use text. One needs to remember that MDC is a 1/2 rate code, which means that 50% of every message is FEC. You may be able to decode the data stream, but don't expect to see crystal clear messages popping up on your PC. It's just not going to happen.

Good Luck!

If you are looking for a base/mobile scanner, I'd suggest going with the
Uniden Bearcat BC-895XLT. I bought mine for about $200. It does
everything the Radio Shack scanner does plus adds CTCSS scan and
decoding. It is also capable of connecting to the computer for
programming or even scanning with computer control.

This is a **BRAND NEW** Trunk Tracking, Hand Held scanner. Uniden #BC235XLT.

I need the money, so I need to sell fast. $175 (INCLUDES SHIPPING).

Contains original box, manuals, two (2) high capacity battery packs, charging base, charger, ear phone, belt clip, antenna, etc.

Rated VERY HIGH on this newsgroup and other sites.

I have a great reputation on the net. I buy/sell a lot. If in doubt, you can check my e-bay rating. My e-bay name is: speedracer5.

I can supply references if needed.

I rode herd on the FCC's portion, which was to supervise the gathering of evidence, examining the case for sufficiency and conformity with procedural requirements, preparing the complaint and warrant, presenting it to the US Attorney and the judge, delivering it to the Marshal Service for execution, and assisting them in the identification of equipment to be seized.

> sounds like you would have been good
> candidates for utilization of unnecessary force, given the
> situaiton, as well as possible violation of certain
> individual rights ...

For the record, in the memorable words of Judge Sam Conti who first formulated it, the search warrants (which were executed by the Marshal Service, NOT by the FCC) all said "using force deemed appropriate". When I once mustered up the courage to ask what that meant, his answer was "mess up and you'll find out". We never had occasion to "find out".

Consider that a seizure pursuant to a warrant was for us almost a last resort in a process where there were many attempts to secure voluntary compliance before it became necessary to go that route. I, for one, was and still am very conscious of the power vested in such a warrant and the need to not abuse it.

Both I and the US Attorney's folks were overly cautious to avoid exposing our respective folks to what is known as a Bivens action, which is a lawsuit for damages which can be brought against an agent for violation of an individual's rights by intent or negligence - the equivalent of a "civil rights suit" brought against state or local agents.

> "if it moves, we shoot" ... sounds
> like a bunch of juvenile, hormone-popping cowboys ...
> doesn't do much for the image of the FCC or the marshal's
> service ...

Translate that phrase to "if the on-scene expert identifies it as radio equipment specified on the face of the warrant it will get seized regardless of the protestations and fabrications of the individual or the attempts to disguise or hide it". Does that make more sense?

What is being emphasized is that if we get to that point, there is no longer any negotiation with the operator, that stage having been passed a long time before (see my comment above).

> .... now I know you're gonna tell me some of that was really
> necessary in reality, which was probably true in a few cases
> .... so, some details might be in order to put such "effort"
> into its proper perspective, given the times and tendencies

"On my watch" we never had occasion for the Marshal Service to need to use force on an individual, although other offices have had to. It came close on one or two occasions, but we worked with good Deputy Marshals who could defuse the situation before it got out of hand. Such decisions are really up to the Marshal Service, not to the FCC agents.

We did have numerous occasions to enter premises or spaces within a premises using force applied by tools. That, too, was a last resort - we usually had an on-call locksmith master-key us into a locked premises pursuant to a warrant to enter the premises and the explanation that the Marshal Service had the authority of the court to "take the place apart" was usually sufficient to persuade the individual to make access to the proscribed equipment possible without that necessity.

Final comment - I feel sorry for those folks who just don't have enough sense to keep themselves from getting into a situation where as seizure is necessary.

I've never tried it myself, but I hear good things about the old fashioned burglar alarm foil tape for windows. You can make an antenna that looks like part of an alarm system. So fairly elaborate layouts might be possible, if you have enough windows. Also try large metal structures inside the apartment, I had good luck with a king size wire spring mattress. Also consider surreptious antennas. I've used vey thin (magnet wire or coil wrapping wire) for short term setups. If you have a back porch cosider stapling a wire against the the undersides of the timbers. You can disguise an antenna as a clothesline, too. Try hooking up to aluminum gutters and window frames, especially if they aren't grounded - beware of static discharges.

Source record: 137063

I'm planning to purchase a handheld scanner. I think I have it narrowed down to a Yupiteru 7100 or an iCOM R10. I have browsed the net looking at several pages of info but I am no closer to a decision than before.

Is there any company support for the Yupi radios in the US? I see that iCOM has a US presence.

I am looking for a very flexible systems that gives me all of the bells and whistles. At this point computer control is not an issue.

Are these radios in the same league or am I comparing apples to oranges?

thanks

>benifit. The digital systems bring more than just privacy to the
picture.

First, the FCC has nothing to do with radios in Durham, Ontario,
Canada.

Second, the idea that the FCC is "driving the moves to digital" is a
myth perpetrated by radio equipment salespeople and the gullible
politicians who believe whatever they say, lacking any expertise of
their own. There is no set standard for digital communications
because the FCC refuses to choose one. They are certainly NOT forcing
any agency to go digital.

The move to digital is being driven by PROFIT on the commercial side
and by PARANOIA on the political side.

I am suprised with all the great documentation out there that you even
feel that the Icom is in the Yupiteru's league. It isn't. It does have a
few more bell and whistles and computer interface, but for raw

performance and strong basic functions (USB, LSB and decent HF performance as well as the best VHF and UHF performance money can buy) the Yupiteru is head and shoulders above the Icom. Also if you can spend a few more sheckels, opt for the MVT-7200 which is the one with sideband as I believe the 7100 which is an older model comes without it. Also the 7200 comes with a high quality Murata filter for the narrow setting on SW. Good Luck. You can buy it directly from Javiation or check out their web site. As for U.S support there isn't any. Get over it.

5725. Changing EL on 895

Newsgroup: rec.radio.scanner

Hi to all:
I was wondering if it's possible to change the
EL color on the BC-895 ?
Occasionally I find the orange display hard to see and thought that a
blue or green would help.
Or should I just be happy with what I have:)
TIA Chuck

5726. Re: Changing EL on 895

Message-ID: <365B77A8.BBE43925@globe-net.net>
Source record: 137080

I belive the BC895 uses an LED matrix for the backlight, not
an "EL" (electroluminescent panel), at least that's the case
for the PRO-2042 which also has an orange display (I believe
it has 9 LEDs for the display). The tricky part is gaining access
to them, after that it shouldn't be a big deal to swap them out.
The blue LEDs are still expensive. Green, red, and yellow are
dirt cheap. Don't buy any LEDs before pulling the panel off.
There are many different sizes & styles of LEDs.

Good luck,

Robert

From: Bob <rshprd@ibm.net>
Message-ID: <365B8362.7AC97627@ibm.net>
Source record: 137082

Recently acquired an old Regency MX7000 scanner. Seems to work pretty good, although not much memory & really slow scan speed. I can over look this due to it's coverage of AM/NFM/WFM 25-550Mhz & 800-1300MHz. Seems like nice bench tool.

However, it would be nice to have a manual and/or schematic for the thing. If anybody knows of a source, pointing me in that direction would be welcomed!

Thanks!
R.Shepard

5734. PRO-43 modification FAQ

Newsgroup: rec.radio.scanner
Date: 1998-11-24 00:00:00 UTC
From: gdallal@world.std.com
Message-ID: <F2wsuM.Ewx@world.std.com>
Source record: 137178

Would someone like to take over the FAQ? I've been happy
to post it every so often, but I've moved on to other things.
Even though it's been years since the PRO-43 had been sold,
there is still occasional need for updates. This latest set
of updates, thanks to F. Barry Mulligan, convinces me that the
FAQ needs to be maintained by someone more active in the
hobby than I am at the moment.

Thanks.

--Jerry

Radio Shack PRO-43 Modifications FAQ
<Last modified November 23, 1998>
<altered sections indicated by * in TOC>

CONTENTS

* 1. Introduction
2. Out of the box frequency coverage
3. Which units can be modified for extended frequency
reception?
* 4. Companies that will modify the PRO-43 for extended
frequency reception
5. The modifications
extended receive 800 MHz (original mod + solderless)
extended receive 6-1000MHz
keypad beep delete
* improved audio
attaching an S-meter
* 400 memory channels
extended receive (30-68MHz for European model)
6. Some fixes
Unit reset
* Freeing from lockup after all banks deselcted
---
1. Introduction

As long as there is a continuing demand for it, this PRO-43
modifications FAQ will be posted every month or so. In large
part, it was based on and grew from the file PRO43.MOD from
pub/hamradio/mods/tandy at oak.oakland.edu .

The FAQ now includes mods for

(1) extended receive (800 MHz:
original mod + solderless)
(2) keypad beep delete
(3) improved audio
(4) attaching an S-meter
(5) extended receive (30-68 MHz for European model)

There is also a mod for 400 memory channels, but, to quote its author, it is very complicated, should only be attempted by someone with moderate to advanced electronics experience, and is not for the faint of heart or the "weekend technician." A brief description is included at the end of this FAQ. If the mod were included in its entirety, the size of the FAQ would be increased four-fold.

---

2. Out of the box frequency coverage

30-54 MHz
118-174 MHz
220-512 MHz
806-823.9375 MHz
851-868.9375 MHz
896-999.9875 MHz

---

3. Which units can be modified for extended frequency (800 MHZ) reception?

Note: In the United States, it is against the law (Electronics Communications Privacy Act of 1987, public law 99-508, amended 1994 by public law 103-414) to listen to cellular or cordless telephone communications. However, it is not illegal to own equipment that can receive or can be modified to receive such communications, even though it became illegal as of April 1994 to manufacture or import equipment that could be easily modified by the user to receive cellular communications. Equipment manufactured before the cutoff date can continue to be sold until stocks are exhausted. While businesses are forbidden from importing cellular capable scanners for resale, the question has been raised whether an individual can legally import such equipment not intended for resale. The issue is not explored here.

Which PRO-43 units can be modified for extended receive? The best information is that units sold in the US and Canada can be identified by the following scheme

Modifiable | Nonmodifiable
|
serial number no A in # | begins with A
FCC-ID AA020-300 | AA020-300A

There have been rumors that the correspondence between serial number and FCC-ID may not be perfect, that is, there may be

some units judged modifiable by the serial number and nonmodifiable by the FCC-ID, and vice-versa. Anyone with a such a unit should send a message to gdallal@world.std.com so that the information can be incorporated into this FAQ.

Date codes: Inside the battery compartment is a paper label containing the date of manufacture in the form "month A year". For example, 5A3 is May, 1993. The cutoff date after which units could no longer be modifiable is April, 1994 (4A4). So far, the earliest reported date of manufacture of a nonmodifiable unit is 3A4 (March, 1994). There have been *no* reports of a modifiable US 3A4 unit. However, there have been reports of a modifiable Canadian 10A4 unit; it did not have an A in the serial number.

Until the rumors surrounding imperfect correspondence between serial number and FCC-ID can be settled, it is better to check the FCC-ID. But be careful. All units have A's in the FCC-ID. Only nonmodifiable units have an FCC-ID that ends in A.

THE PRESENCE OR ABSENCE OF A FINAL 'A' IN THE FCC-ID
IS A DEFINITIVE WAY OF DETERMINING WHETHER A PRO-43
CAN BE MODIFIED FOR EXTENDED FREQUENCY RECEPTION.
IF THE FCC-ID IS 'AA020-300', THE UNIT IS MODIFIABLE.
IF THE FCC-ID IS 'AA020-300A', THE UNIT IS NOT MODIFIABLE.

It has been reported that some units currently being made for sale overseas can be modified for extended 800 MHz reception. However, it is not known whether this applies to all overseas units or, if not, whether there is a way to distinguish modifiable units from nonmodifiable units.

The PRO-43 was produced under two brand names. My 3A3 unit carries the Realistic name; my 12A3 unit carries the Radio Shack name. At the moment, it is not known whether this represented a changeover or whether both types were produced side-by-side for a time. It is also not known whether their electronics are different.

There are no software modifications for the PRO-43. It is not possible to extend the frequency range of the radio by pushing buttons on the keypad. Such modifications are possible with other models, such as the PRO-51, but *not* with the PRO-43. The PRO-43, made by GRE (General Radio Electronics) of Japan, is one of Radio Shack's few triple conversion units. Radio Shack scanners with software mods are double conversion units made by Uniden.

Modification procedures for other radios are available by anonymous ftp from the pub/hamradio/mods/<manufacturer> subdirectories at oak.oakland.edu.

There is some debate about whether step (5) of the
extended receive modification is worthwhile. According to Bob
Parnass, from his "Improved Audio Mod", below:

"Now that I have a schematic, I see that the European
version of the PRO-43 has different coils and
capacitors in the low (mid) band front end filter.
That explains why the 75 MHz sensitivity isn't stellar
after adding diode D3 to enable 30-88 MHz coverage."

So, if you trash the diode in step 4 or want to quit while
your ahead, don't lose sleep over it. On the other hand,
quoting ray_reese@tscnet.eskimo.com (Ray Reese),

When I purchased my PRO-43 and did the mod for adding
54-88 Mhz, using the removed cell. diode, I wanted to
be able to listen to the sound carrier for the tv
channels 2-6 as well as the 72-76 Mhz band. It is
worth the trouble to make the mode and it does work
well in my area, despite not having the correct coils
for that band area. Do the mod anyway, but [if you've
trashed your original diode], use a 1N4148 fast-
switching diode. Perhaps a 1N914 might do the job
also. They can be found at Radio Shack for a cheap
price.

---
4. Companies that will modify the PRO-43 for extended
frequency reception

I am unaware of anyone offering a commercal modification
service at the moment. F. Barry Mulligan reports, "The FCC
has decided that modifying scanners commercially constitutes
manufacture and has cracked down rather firmly."

---
5. The modifications

From: armille@afterlife.ncsc.mil (A. Ray Miller)
Summary: cellular (870-890 MHz) and low band (51-88 MHz) restoration for PRO-43

A few people have mentioned the cellular mod for the PRO-43; it turns out
you should not remove but MOVE the diode. Doing so allows cellular coverage as
well as low band (up to 88 MHz) coverage.

Acknowledgments to Grove Enterprises; this information came from them.
They are selling the PRO-43 for $300 which is $50 less than Radio Shack.
I have no connection with them other than as a satisfied customer.

PRO-43
Cellular Frequency Restoration and Low Band Expansion

Note: It is not lawful to monitor cellular or conventional mobile telephone
conversations.

The following procedure requires familiarity with microcircuit soldering and will violate your warranty. Grove Enterprises assumes no liability resulting from its attempt, nor will accept the modified scanner for return under any condition.

TOOLS NEEDED: Fine point, low power soldering pencil; solder wick or a desoldering tool; pointed awl, hemostats or pointed tweezers; small Philips screwdriver; solder.

1) Remove the battery, antenna and back cover (held in place by four screws).

2) Remove the six screws holding the top circuit board in place. Carefully unsolder the two antenna connections from the board. Bend the antenna ground tab fully up from the board. Carefully lift the board, unplugging the black connector at its base, and lay the board out of the way on its bundle of colored wires.

3) Remove the two screws from the next board and lift it, carefully unplugging the white connector at the bottom of the board. Lift it up and lay it aside on its brown wire (which can be unplugged if necessary).

4) Unsolder and remove the metal shield from the final board, revealing the microprocessor; note the row of diodes labeled D1-D5 above it. Only diodes D1, D2, and D4 are present; assisted by a pointed tool, unsolder and remove D4, the lone diode (this restores cellular frequencies which will be searched in 30 kHz steps).

5) Resolder the removed diode carefully into position D3 to extend low band coverage to 88 MHz.

6) Reassemble the boards, paying particular attention to the alignment of the plugs. Test the radio by entering any frequency between 870 and 890 MHz (cellular) and 51-88 MHz (low band).

BTW, I did something similar [to the mod that follows] but MUCH easier... No soldering, removing antennas, PCBs, etc..

Just open up the Pro 43 and look down on the bottom PCB from where the batteries usually lie. You'll see the diodes there. Simply take an xacto knife and and break the solder on the D4 diode (left-most on mine) on the side facing you. I just cut back-and-forth for a bit. Once the solder (it's surface mounted) is weak enough, I just bend up the diode a bit from the PCB. Presto. I left mine hanging on the one side with solder. If you continue to work it a bit, you can probably remove the whole diode.

From: springel@umich.edu (Jason G. Springel)

Subject: MODing a Pro-43 without soldering

I just purchased a new Pro-43 to replace my Uniden 200XLT after reading many of the praises for the Pro-43 on this newsgroup. I decided to try and MOD it, but don't have a lot of experience with a soldering iron. After examining the scanner's innards, I found it was quite easy to "fix" with nothing more than a minature philips screwdriver and some small needlenose pliars.

********** Standard Discalimer from other MODs:

1-It is against the law to monitor cellular or mobile telephone calls.

*****2-Procedures outlined below [DO NOT] require knowledge of microcircuits, soldering and assembly techniques.

*****3-You will [NOT] need a low-wattage soldering iron, solder and other various tools to help in the procedure.

4-The following procedure will void your warranty.

****
Here is my new MOD:

Step 1

Remove the battery, antenna, and back cover which is held in place by four screws. Place the scanner keypad-side down on your working surface.

Step 2

Remove the six screws holding the top circuit board in place.

Step 3

Using a VERY small screwdriver (I used one from a Radio Shack kit), remove the two screws from the lower circuit board. Looking down at the unit, you will see that the screw on right side of the lower circuit board can be easily removed. Remove the screw on the left side by by sliding the screwdriver between the top circuit board and the metal frame which holds the two boards together.

Step 4

With these two screws removed, you can now lift the entire top panel (antenna, volume, and squelch knobs) along with the top two circuit boards as one unit. The two circuit boards will be connected to the final circuit board (the one attached to the front section of the scanner) by several wires. Simply set the top panel/circuit boards alongside the front section of the scanner and you can leave these wires connected.

Step 5

The microporcessor is located under the large metal shield on the final board (the front section of the scanner with the display and keypad).

If you look under metal shield from the side closest to the bottom of the scanner, you should see the row of diodes labeled D1-D5.

Only diodes D1, D2 and D4 should be present.

Use a small pointed tool to break off D4. You actually don't have to remove it completely (unless you want to use it to restore additional frequencies as explained in other MODs), you can just lift one side so it dosen't make connection and then put a small piece of tape or heat shrink over it, so it won't. Make sure it's not lifted to high or the boards will not fit.

This will restore Cellular Frequencies in 30 kHz steps.

Step 5

Reverse the process to replace the top panel/circuit boards and the two screws that connect the lower circuit board. Replace the 6 screws from the top board. Replace the cover, etc.....

...the diode positions on the cpu board, of which only three are filled look like this. Where X equals a diode soldered in place.

D5 D4 D3 D2 D1

O X O X X Normal configuration

O O O X X Cellular modification(D4 removed)

O O X X X Lo-Band modification(D4 in D3's place)

These directions were based on an original MOD design whose origins I do not know. My thanks go out to the original author of that MOD!
Hope this helps those of you who do not own a soldering iron!

PRO-43 Shortwave & Extended Receive
Al Mellon N8KLI
ification is only possible on radios able to be modified to receive the full 800 MHz range.)

Scope and nature of the modification: To allow the PRO-43 to receive frequencies from 6 MHz to 1000 MHz. This is accomplished by setting the PRO-43 to non-standard splinter frequencies, the CPU will then step the radio beyond the normal band edges. To derive the non-standard splinter frequencies it is necessary to change the diode configuration matrix, and to use the monitor-search function. The hardware modification should take about thirty minutes. The remaining programming / search will take as little as 45 minutes (depending on how interested you are in the signals you encounter during the 806 MHz to 30 MHz search to be run).

I made a few attempts to make deals with various radio mod shops. Most felt the time needed to make key pad entries was too long to make a profit.

< This is a lengthy modification. It can be found in its entirety in /pub3/hamradio/mods/tandy/pro43swl.zip at oak.oakland.edu

and at http://204.134.124.1:80/kc5kto/pro43swl.html>

From: ross@novax.llnl.gov
Date: 19 Aug 92 16:51:08 GMT

Here is my keypad beep delete mod for the RPO-43:

1. Remove battery.
2. Remove back cover (4 screws).
3. Remove top board (6 screws, desolder two antenna connections and bend antenna ground lead up out of the way). Be careful of black connector at bottom of board. Flip board over and lay aside (wire connectors need not be disconnected).
4. Remove middle board (remove 2 screws and wire connector). Be careful of two multi-pin connectors along underside of board. Set middle board aside.
5. Locate 10 pin connector on side of bottom board (labeled CN3). Note that one end of connector has pin 10 labeled as such. Count back to pin 6 and bend pin 6 ninety degrees towards the large RF shield. Make sure the bent pin clears the RF shield.
6. Reassemble and your done OR do the cell mod since you are so close.

Have fun. Gary Ross >usual disclaimer>

FB Mullligan adds, "The 'beep mod from Ross leaves Q307 floating and possibly drawing power / reducing audio. A better idea is to disconnect R363."

Subject: Improved audio for the PRO-43 portable scanner
From: parnass@cbnewse.cb.att.com (Bob Parnass, AJ9S)
Date: Wed, 2 Dec 1992 01:15:35 GMT

IMPROVED AUDIO FOR THE PRO-43 SCANNER

by Bob Parnass, AJ9S

[FB Mulligan reports, "Bob Parnass's audio mod was updated to recommend replacing C341 with a .002uF capacitor, rather than simply removing it. The reference to "... overloads the PRO-43's small, internal speaker ..." should mention that the original speaker was replaced with a 500mw version in later production. The replacement was available from National Parts as GRE part nbr. 3P127A."]

The Radio Shack PRO-43 scanner audio is too bassy.1 The lack of treble makes it difficult to hear the PRO-43 in noisy situations, especially while listening in a car or truck. Louis Shirley sent me a schematic and suggested I remove C341, a tiny 0.015 ufd surface mount capacitor.

I'm glad to report that removing C341 made a great improvement. The audio is now much "crisper," more like the Uniden 200xlt, although still not quite as

loud. Turning the volume control up still overloads the PRO-43's small, internal speaker, but there's less need to do that once C341 is removed.

The PRO-43 contains 3 printed circuit boards, and the middle (second) board contains the audio circuitry. Finding C341 is difficult, as it is neither marked with a value nor a component designation. It is located on the foil side of the middle board, under IC304, an LM386 amplifier IC. C341 is in parallel with, and physically next to, R350 (33,000 ohm). R350 is slightly larger than C341 and is marked 333. Both R350 and C341 are connected between pin 2 of the LM386 and ground.

A Note About 50-88 MHz Reception

Now that I have a schematic, I see that the European version of the PRO-43 has different coils and capacitors in the low (mid) band front end filter. That explains why the 75 MHz sensitivity isn't stellar after adding diode D3 to enable 30-88 MHz coverage.

---

1. See "PRO-43 Product Review," by Bob Parnass, AJ9S, in the November 1992 RCMA Journal.

Subject: S-Meter for PRO-43
From: schuster@panix.com (Michael Schuster)

Found this on the Fidonet scanner echo:

=====begin quoted text=================

Date: 02-06-93 00:24
From: Bill Cheek
To: All
Subject: PRO-43 S-Meter!

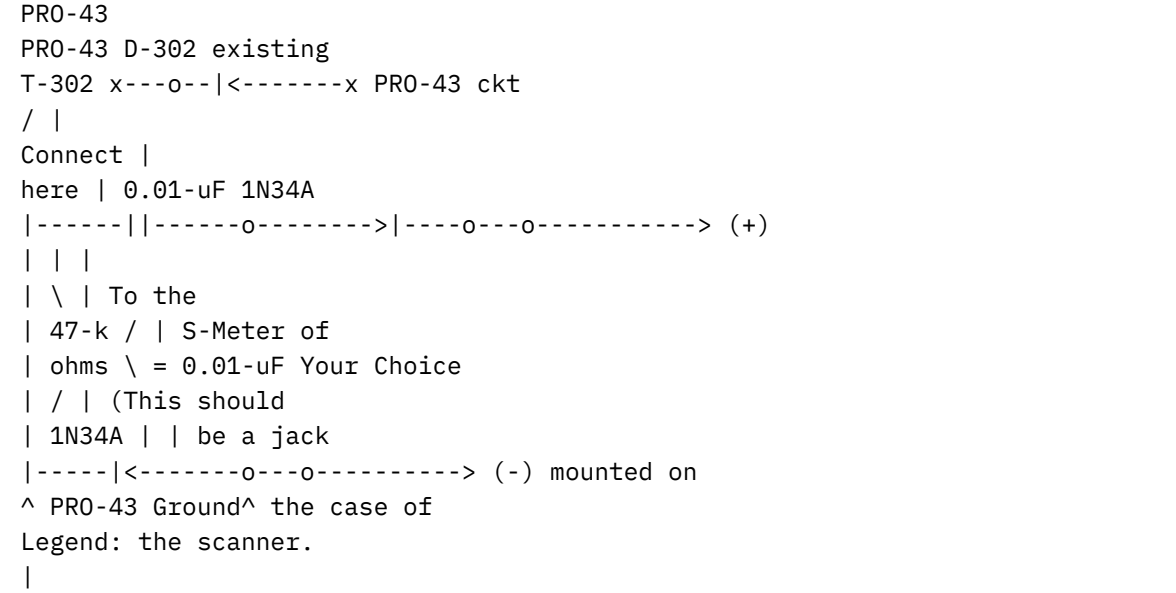
Greetings Scanner Fans!

It had to happen! The fundamentals for an S-Meter exist alive and well in the PRO-43! Only a simple circuit and your choice of meter, analog or LED, is required for a jim-dandy S-Meter function!

The key point in the circuit is the cathode of D-302 located on the bottom (solder side) of the AF Board (middle board). You will need the Service Manual for the PRO-43 to find it as it's not marked and it would take me 10,000 words to guide you to exactly where it is located. Call Tandy National

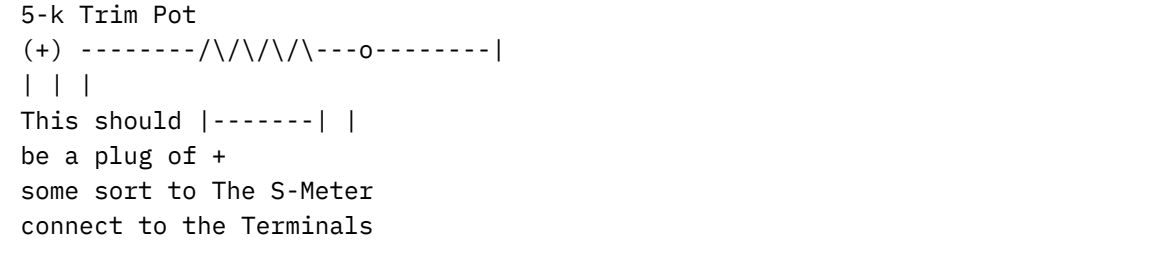
Parts at (800) 442-2425 to order your manual: approx $10. Now here is the deal:

Locate D-302 and either build the following circuit right there on the back of the AF board in the vicinity of D-302, or solder a wire to the cathode of D-302 and route it to somewhere else more convenient to feed the below circuit. This wire ought not to be very long, though, say not more than a couple of inches. Refer to the ASCII schematic diagram as follows:



PRO-43
PRO-43 D-302 existing
T-302 x---o--|<-------x PRO-43 ckt
/ |
Connect |
here | 0.01-uF 1N34A
|------||------o-------->|----o---o-----------> (+)
| | |
| \ | To the
| 47-k / | S-Meter of
| ohms \ = 0.01-uF Your Choice
| / | (This should
| 1N34A | | be a jack
|-----|<-------o---o----------> (-) mounted on
^ PRO-43 Ground^ the case of
Legend: the scanner.
|
1. ---||--- and = are 0.01-uF capacitors; disk, mylar, monolythic, chip
|
2. --->|--- and ---|<---- are germanium diodes, 1N34A
| is cathode
< is anode
3. o means a connection, preferably soldered
4. The 47-k resistor is self-explanatory, I hope.
5. -------- and | are wires/conductors.
|
|
6. x is existing PRO-43 circuitry

If you use an analog meter, preferably a real S-Meter like salvaged from an old junked CB rig, then rig it as follows to connect to the circuit above:



```
mating jack on -
the scanner |
|
(-)----------------------------|
```

You can also build the 10-segment LED S-Meter as shown in Volume 2 of my SCANNER MODIFICATION HANDBOOK, available from leading mail order radio dealers everywhere. ISBN 0-939780-14-3 published by CRB Research Books, Inc. Commack, NY.

After connected and working, locate the PRO-43 very near a known strong transmitter, perhaps a ham transmitter, a police cruiser, your favorite security guard's handheld or right next to a cordless telephone, or anything else known to transmit a strong signal. Tune the scanner to the frequency, and adjust the 5-k trim pot above so the meter reads exactly full scale. All other signals will read proportionally lower to yield "relative signal strength" measurements! A hell of a circuit here, boys & girls! Have fun!

Subject: PRO-43 w/400 CHANNELS HERES HOW!

IT IS NOT FOR THE FAINT OF HEART however.

PRO-43 ENHANCEMENT
MEMORY EXPANSION & "FADE-AWAY" LIGHT
Brett Bennett 4/12/94
bbb@kuhub.cc.ukans.edu
Copyright 1994 B&D Electronics All Rights Reserved

[Only the introduction is given here. Please contact the poster for the full mod.]

INTRODUCTION

The following document details two enhancement modifications that are possible on the Radio Shack PRO-43 scanning radio. The first modification doubles the factory standard memory capacity, allowing you to enjoy an additional 200 channels of memory, plus 10 more monitor memories. After completing the first modification, it is a fairly simple matter to add a 7 to 10 second delay feature to the LCD back-light lamp circuit. I designed and performed these modifications on my PRO-43 and they do work. As I understand it, there (has been/is being) presented in WORLD SCANNER REPORT a similar memory expansion. I have not seen this modification and for all I know it is a better way of doing it. What is presented is a 'clean-room' design of my own that to the best of my knowledge is the only one to also offer a time-delay for the LCD back-light. Having said that, let me say:

I ASSUME NO RESPONSIBILITY FOR ANYTHING THAT MIGHT HAPPEN TO YOUR RADIO SHOULD YOU OR ANYONE ELSE ATTEMPT THESE MODIFICATIONS. WHILE REASONABLE CARE HAS GONE INTO THE PREPARATION OF THE FOLLOWING DOCUMENT, I CAN NOT GUARANTEE THAT THERE ARE NOT ERRORS.

The procedure described below is very complicated, and involves the soldering and desoldering of very tiny components and the cutting of printed circuit board traces. While the procedure is not irreversible, it will leave permanent scars inside your scanner. It should only be attempted by someone with moderate to advanced electronics experience. I don't think it should be attempted by, to quote someone else, a "weekend technician." If as you read through this you feel intimidated by the jargon and required procedures or if an electronic schematic looks like a strange piece of modern art to you, then this might not be the 'mod' you are looking for. The following document will assume you have obtained the materials listed below, especially the Service Manual, and you have studied the circuit in some detail. I will not describe in great detail where every component is or where every solder point on the logic board should be placed. Having the Service Manual, and having studied the drawings therein will allow you determine to where it is I refer.

REQUIREMENTS

1 - PRO-43 Service Manual. (Tandy Parts # MS-2000300 - approx. $6.00)
1 - CD4053 - Triple - SPDT analog switch - Surface mount package (DigiKey #CD4053BCM-ND - approx. $1.50)
2 - 93C67 EEPROMs (Tandy Parts # MX-8050 - approx. $13.00/each)
1 - 100k x 5 resistor network. Common lead type. (DigiKey # Q5104)
1 - UN2111 PNP transistor (Q1 on Logic PCB. Tandy Parts #)
1 - 1 uF 16v capacitor.
1 - 10 MOhm 1/8-1/16W resistor.
Misc.:
Wire wrap wire-30 gauge. (Radio Shack)
Grounded soldering iron with approx. 1/32" tip or smaller.
Desoldering Equipment.
Digital Volt Meter. (Used to double check your VCC and Ground connections, pre-check switching assembly)
Utility knife with fresh sharp small blade. (Needed to cut traces.)
Strong hand held magnifying lens. (Needed to check solder joints.)
+5-10 Volt bench power supply. (Used to check switching assembly.)

Anti-Static work place and grounding wrist band.
Very fine needle nose pliers, wire cutters.

From: IN%"millingtoj@oldhamlrd-po.oldham.gpsemi.COM"
"John Millington" 17-DEC-1995 04:55:31.71
Subj: RE: pro-43

The European Pro-43 comes with a diode in D1, D3, +D5.
Remove the diode from D5 and solder it in position D2.
The scanner will now cover 30-68Mhz.
Usual disclaimer.
---
6. The fixes

Unit reset (from the owner's manual)

If the keys do not work and the display is random, while
holding down the CLEAR and 0 (zero), turn the power on to
reset the scanner. Note: This clears all the information
Stored in the scanner.

From: IN%"randyrho@nauticom.net" "Randy Rhoades" 14-NOV-1996 00:13:32.24
Subj: Pro-43 Lockup Fix

Several months ago, the unit "locked up". When the radio was turned
on, nothing appeared on the display but the light button worked.
<RS repaired it, snipped>

It happened again.

<RR reports . . . [Before doing this, first try the reset above. GED]>
The problem seems to be in the software. The PRO-43 seems to forget
how to operate if all banks are de-selected. The software prevents
the operator from deselecting all banks but on rare occations this
routine fails. There seems to be no way to recover from this without
surgery. If you know any other way, please let me know.

THE FIX

[FB Mulligan adds, "The lockup problem is well known. It
occurs when, inprogram mode, the user locks out all channels
in a bank (this cannot occur in scan or manual modes). An
attempt to scan this bank causes the lockup. The cure is a
simple reset (press CLEAR and 0 during power on). The rather
elaborate and potentialy destructive procedure described by
Rhoades is not required."]

There are lots of mod articles around describing the disassembly of
the PRO-43 so I'll omit it here. Disassemble the scanner down to
the CPU board and remove the metal shield. CAREFULLY lift pin 3 on
IC 2 so it no longer makes contact with the circuit board trace.
Reconnect the radio module to the CPU board, hold the back cover

in place, and insert the batteries. Turn on the power. The display will look a little odd, but it will be apparant that the unit is scanning. Press the number 1 on the keypad until the scan indicator on the display shows band 1 is operating. Turn off the power and disassemble the scanner again. Re-solder pin 3, replace the shield, and reassemble the scanner. It's fixed !

The only trouble with the procedure is that all of your programmed frequencies are dust. Just reprogram and thank God it works again.

5744. Sound Card MDT decoding in Phoenix (Yes, it does work, folks)

Newsgroup: rec.radio.scanner
Date: 1998-11-25 00:00:00 UTC
From: Phil Smalley <ziggy7445@yahoo.com>
Message-ID: <73hc0b$e7$1@phxtst22.phx1.aro.allied.com>
Source record: 136938

Ohhhhhh boy, do I have some news....

I did manage to get the program to run for me finally (works on my laptop, but not my desktop PC - soundcard is hosed, D'OH!) and it works sensationally...

For all you fellow Phoenix scannists out there, I have good news and bad news. First the bad news (for me at least, maybe you won't care):

Phoenix and DPS MDT's use what sounds to be 19.2 (Could be 9.6 but it sounds alot faster to me - just an educated guess) so this program won't do it. However, if I do locate (hint, send it if you have it) the spec's for that protocol, I should be able to hack the provided source code and come up with a decoder for us in a couple of months (Unless Gordon wants to tackle that one too - if so you've got a beta tester right here). But now for the good news:

It works for:

Glendale PD on 856.2125
Scottsdale PD on 854.9625 (I think, Check the SWFD for the exact freq)
Tempe PD on 855.2375

Oh boy, does it work. Just wait until you try it - you won't believe the stuff they send out on those MDT's! I'm talking about drug busts being coordinated, call details you'd never hear over the air - how about the phone number of the caller, for starters? Plus calls for service that don't get broadcast (saw one last night that said the bad guys had a scanner. Can you imagine if they had a computer too? D'OH!) How about the ability to not only intercept a wants/warrants check on someone, but send that screen to a FILE?? Plus, just being able to *read* a call as it's being broadcast, now that is just the coolest thing ever.

I have to admit this is my second day on practically no sleep. I feel just like I did when I got my first scanner - I'm hooked. Gordon, keep up the great work, and tell Motorola to suck an egg if they come knocking. I don't see why they should care, they could just shrug their shoulders and sell their customers a new mega million dollar 19.2 system (but damn, I sure hope not!)

Tomorrow I'll be spending turkey day in the East Valley, so I'll report back on Chandler and Mesa's systems, unless someone wants to try them today. If so, email me with your findings.

I really hope I can get Chandler's to work, because they arrogantly claim it can't be done. See:
http://www.primenet.com/~chandler/html/service/police/freq.htm.

I won't do this (and neither should you, if you like to monitor MDT), but wouldn't it be funny to send them an anonymous package containing a print out of that page, printouts of one whole day's MDT traffic, and a note that says "oh YEAH?!?!?" Ha, ha ha ha....that'd be HILARIOUS.....

Happy monitoring!
-Phil

Yeah, a FEW... lately we've had several. Yawnsville. Glad I found that MDT program or I'd be bored stiff. Pursuits are a pretty rare bird out here, and I don't think we've ever chased a BUS.

Nope, not here at work anyway. Our firewall doesn't permit streaming anything (it sucks dammit, what a rip.)

We have one from central AZ somewhere, I found the link once by accident. I think it was on www.azfamily.com but I'm not positive. Isn't always active, but better than nothing.

> I use the telephone line as a shortwave antenna and I get excellent reception.

I have good receptions with an little (selfmade) magnetic loop. Calculating progs for those antennas are available on HAMs ftp-sites. Mine goes from 3.5 to 18 Mhz -but you can build it for
every frequency range. If you want you can feed the signal to an selective preamp. I (can) do it
with an old FRT7700.Best is when the antenna is not to far away from your receiver because you will
have to tune this antenna new every 50 -100 khz. But this means its a very selective antenna wich
holds away strong singnals from the HAM-bands. I have great results with it in ground-floor appartment in middle the city of Berlin/Germany with my Sony 2001D/2010 and the ICOM PCR1000.

>ANALOG - to - DIGITAL

Yes, it is an EFFORT to set a standard. APCO-25 has been PROPOSED as
a universal digital standard, however, the FCC has NOT mandated
APCO-25 or any other protocol as THE standard. They have refused to
back any proposed protocol, preferring to let the market sort it out.
Same policy as for AM stereo, and you can see what that did to the
market.

5751. Begining Handheld?

Newsgroup: rec.radio.scanner
Date: 1998-11-25 00:00:00 UTC
From: "Michael D. Hofer" <featheredfrog@geocities.com>
Message-ID: <365C361E.1F73@geocities.com>
Source record: 136945

Okay, a first post in any scanner NG.

I've been playing with my pro-2021 ($10!! at a garage sale) off and on for about five or six months. I'm having lot of fun listening to the activities of the SFPD and local fire depts, thanks to the book I got at RS. Since I found the voicepager freq, things have gotten _real_ busy, too.

I've since noticed in the book of freqs a listing for the (ahem!) Long Island Railroad. Now, It would be of _great_ interest to me and to my fellow passengers to know just _why_ we're sitting in a train while others are passing by. Can anyone recommend a beginner's handheld that I might try to listen in on the inter/intra train conversations? I'm at work, and don't have the freqs handy, sorry to say, so I can't describe coverage.

But: what's a reasonable (remember my 2021...) inexpensive handheld for a beginner? What should I look for at the garage sales, and what should I stay away from? Would one of the old xtal handhelds be economical for my _initial_ purpose? Can I still get crystals for them? There are only four or five listed frequencies for the trains.

To obtain a copy of the monthly flyer, which contains major items when first put on clearance, go to www.radioshack.com. Other clearance items depend upon store availability. Some managers are smart enough to let you review their latest data printout of clearance items within the store. It is a dangerous practice though! I have bought many items that I will never use just because they were at giveaway prices or because I have not seen them for sale in the last 10 to 15 years. Scotty

>>Does anyone know a Web site where the list of current RS Clearance Items can

I used to have a pro-2046 and I'd pick up phone conversations around 900mhz. I know have a 2050 and it picks up nothing there.

is it because the 2050 has triple conversion instead of double?

I don't know if I was getting cordless phones or cell phone images.

What's with these fools? Every post they make is cross posted to a number
of other newgroups!!!
Isn't this against N/G policy????

Professor....come and get um!

Watch out you two, You might be in for a nice surprise when Professor finds
out what your doing.

Another thing, why do you post your messages to make it impossible for
anyone to reply privately to you? Do you have something to hide? Are you
afraid of being found out? What's the real deal here?

Granted you two have an awesome legal vocabulary but come on now, do you
think half the people you post to are going to understand what you have said
with your Blacks' Law Dictionary words?

You might have been with the FCC and maybe you are lying to look good. I
don't believe you and that is my perogative. But I think you had better
delve deeper into what Toll has told you. You might be shocked at what your
FCC counterparts have been doing in Southern California.

Just got the Icom R-10 scanner and have to say that after sitting down with it for over and hour I am not impressed, nor do I like it very much. Guess I'll play around with it until they rework the 8200 and I'll try that one. This will suffice until then - and if all else fails I'll go back to an 8000. This Icom just don't get it, though. Too much of a pause delay and the programming is too complicated. I am having a heckuva time containing the scan to particular banks...it just keeps going to the other banks...how the heck do you lock out a tone frequency - you have to engage SKIP? Not even gonna bother with the computer control. I am disgusted with this one..better luck next time

Should have tried the Alinco maybe...:(

Why are we soo concerned about this new law?
If it will help clean up cb, isn't a good thing?
Larry

I have 0.5.8 here, is there a later version? I should say, when
installing it I had a snag with one of the .dll's. I had to extract
one from the .cab file to /windows/system then it went very smooth.

>

First of all, it simply does not matter what kind of computer, if you
know the software.

Secondly, Motorola sells S-C-A software, the leader in the field.
Cerulean comes in second, (Used to be known as PacketCluster,
now known by many as just a cluster) and then Coded, who still
cannot make their stuff work in scads of situations.

SCA, and Cerulean are both at least once DES encrypted, although
I believe they are both re-encrypting the data again.

Motorola has worked with Cerulean in the past, will still sell the
hardware for a Cerulean system, but they prefer, and sell, S-C-A

www.S-C-A.com is the URL for sca.

Actually, the guy was just gone after in a Civil action. Settlement
was private, but it included turning over the mailing list of all his
customers, assisting in the pursuit of those people, and his Motorola
dealership was cancelled, never to be returned.

No prison time.

The TK software is still out there, on the web even.

It has been my experience in the Durham region, and metro region that Clearnet has a long way to go before being able to deliver public safety oriented communications. I have often had the mike telephone, go "digital" on me, leaving my callers voice, or my voice sounding like a cartoon character under water. I have also lost calls midway through an alarm call, which is frustrating to say the least. The phones are useless undergroung, worse than analog phones. I would hate to be an officer needing back up and seeing" system busy, please wait" on the display.

What I don't unerstand is WHY, The Vhf system seems to have great coverage. All the way up to Beaverton and beyond!

Hmm, probobly not as each city in durham has it's own fire dept, Oshawa went 800, but isn't digtized.

> >Durham has chosen to become a totally secretive police force. Keep in

Of course, trample the rights of citizens, and when one has a legitimate concern,
"It's a manpower issue".... (peronal experience). If they go digital, no one will question why they pull over people and run their names and markers, just because thay are going home late at night.

> Digital is not necessarily scrambled. Scrambling certain sensitive

Okay, If Ham Radio is dying, what is going to replace it that is cheap to maintain.

CBs don't cover a great deal of area without screwing up my radio/tv reception.
CellPhones cost cash. Ham radio is the only "cheap" alternative. Unless there is
another communications device that is going to replace it.

Scan Cat Gold for windows will work with the R10 and many others only problem is its $100. I happen to use it but Haven't tried it out on the AR8200 yet. Programmed My R10 Fine but doesn't or I didn't figure out how to program skip frequencies using the PC cloning cable never got the CT17 interface though to computer control it so I have no info on that.
My 8200 will be my main scanner once I get the Database of Frequencies I want setup. My only complaint on the AR8200 so far is the Alpha Tags and the fact that backlight stays on when it isn't using batteries.

Source record: 136976

I think the big issue here is not CB vs HAM, but the '*' (@$$hole)
mentality of some CB operators. But then, I see more of it
percentage wise in the HAM bands. It's just that there are
millions of CBers and the '*'s really stand out. If there were an
equal number of HAMs, I think the shoe would be on the other
foot.

Yeah, we're so proud of our accomplishments. Like the garbage
on 20 and 80 meters. Like the people who shut down repeaters
if someone from a 'lower class' gets on them. Of the contest
operators who jam simplex operations on 2M because someone
is traveling through on 'their' contest frequency.

Yeah, we have a lot to be proud of.

But we do in fact have a lot to be proud of. But we shouldn't
try to look down at others as if we were perfect.

If you are trying to decode 900MHz pages they are most likely FLEX protocol.
This is a TDM protocol which in no way shape or form resembles POCSAG or GOLAY.
Just a thought good luck.

Source record: 137003

You simply need to find out if they are using a trunked radio system in the area where you live. If so the trunk tracking type is necessary. I suspect NYC is not using a trunked system however if they are be aware that only Motorola analog systems are followed by trunk tracker- - these are the premier systems for public safety but occasionally GE convinces someone to use there system. rshanna@aol.com

for what agency and in what city are you looking for. Contrary to the opinions stated in the public replies thay are not all 800 MHz and there are programs to decode. Although posssibly illegal. What type of rado system does the agency use, what brand and what brand are the computers. Also what is the name of the software mfg: most common would be Motorola, Coded Communicaitons, or Packet Cluster. This info may help me to get you an answer. rshanna@aol.com

> What? Doesn't the phone line get a shot of 120 volts every time the
> phone rings? I had the crap shocked out of me once twisting lines on a live
> phone line JUST when my brother-in-law decided to call. Wouldn't that
> voltage blow your receiver?

Yes. The ringing voltage is 90VRMS - you'll notice it.

However, if you use a small value capacitor to block the 20 Hz
ringing voltage, there should be no problem.

Try connecting through a 100pF, 200V or higher voltage ceramic
capacitor.

It works fairly well - but it tends to pick up processor noise
from phone devices such as answering machines and electronic or
cordless phones. If anyone in your house, or your neighbor, turns
on their computer with a modem, your reception is trashed. The
phone lines eventually are bundled together and will couple HF
noise to each other.

Don't leave it connected when not in use. It is also more
susceptible to lightening strikes.

You can try it, but don't expect miracles.

I would suggest an "active" antenna placed on the balcony.

Cheers,
Paul Grohe

Charlie, I was similarly intrigued by the $169 price in the Radio Shack flyer. The $169 model is the PRO-91, which doesn't have as many features as the $300 model, the PRO-90. However, the PRO-90 is the Radio Shack version, made by Uniden, of the Uniden Bearcat BC235XLT, which sells for a lot less than the PRO-90 and includes a separate battery charging unit.

Here's some great info on the PRO-90:
http://www.strongsignals.net/htm/imp90.htm

Similar info on the BC235XLT:
http://www.strongsignals.net/htm/imp235.htm

And similar info on the PRO-91:
http://www.strongsignals.net/htm/imp91.htm

In fact, the whole http://www.strongsignals.net site is just a superb source of information for the beginner. Way to go, Richard Wells!!

Lots of information about trunk-tracking scanners is at:
http://www.trunktracker.com/

If you want to buy a Uniden on-line, check out:
http://www.national-electronics.com/index.html which is currently selling the BC235XLT for $188.90, including shipping.

Uniden also has an on-line store, where they sell factory-reconditioned used scanners, at: http://www.uniden.com/docs/store/

They're currently offering a reconditioned BC235XLT for $165.

>I rest my case until then.

Some points to consider:

1.) You haven't been around that long, relatively;
2.) You took the wrong month for hiatus;
3.) Until you provide substantiation, you got no case to
rest on, for the time being.
4.) Demanding identification of one person's presence
outside the chronology of a 25-year career as substantiation
of that 25-year career is irrelevant to that 25-year career
in light of all the other existing records supporting that
career. Look around a bit first.

Cross-posted to: alt.radio.scanner,rec.radio.scanner

Hi Robert,

I had the same decision some 1.5 years ago, and decided
for the AOR AR-5000 (not +3) for following reasons:

I have been owner of AOR-3000A and iCOM-7100, both
state-of-the-art base scanners in their days. Where the
iCOM outperformed on outlook, features, and strong signal
handling, the AOR-3000A was much better in the core of
what a scanner is supposed to do: FAST scanning, FAST
searching and plain RECEIVING. AOR outperformed iCOM
on scan speed (50 vs 14 channels per second), selectivity
(just received more remote signals), and ease of operation.

Then came summer 1997, time to upgrade my shack.
I compared AOR AR-5000 and iCOM IC-R8500 and found
exactly the same differences as witrh my old base scanners.

iCOM has brilliant features, text pads, special indicators
and (indeed, it's needed) an optional high precision tuning
circuit (the 7100 needed some adjustment every 6 months),
but the AOR gloomingly wins on basics like sensitivity and
scan speed. I must say I hate the AOR's outlook every time
I see a (picture of) an iCOM IC-R8500, but:

To summarize, the iCOM is a (semi-)professional receiver,
the AOR is a fantastic scanner.

Good luck! Fabrizio

I know the previous poster very well, Rick, and I believe he meant to say 4 or 5 years ago. I remember the incident myself. I also use CB during the warmer months on my bike to help out a friend of mine who is a security guard and has to patrol an entire neighborhood by himself. Myself and 3 other people roam around the neighborhood with scanners and handheld CB's, and if we hear or see anything suspicious that the guard should know about, we let him know on the CB.

Cross-posted to: alt.radio.scanner,rec.radio.scanner

I used to use the MDTW1234 program and the interface for the serial port on my pc but two days ago downloaded the sound card program. When I loaded the software it did not work. Never got anything on the screen. Tried all the tricks they mention in their little help section. Yesterday I downloaded the latest upgrade and it is working 100%. The only thing I had to do was invert the signal. This is done within the program. I am using a 120 mhz pentium pc and a sound blaster sound card.

The information I see on the monitor is exactly what I see on the MDTs that are in the police vehicles. This program works great and I am thinking of dedicating one scanner for MDT and the other for the 800 control channel.

Good luck and make sure that you have the latest loaded.

In addition to the APCO site, is the fact that in the last year or so, the govenrment has admitted that they have secretly been pushing digital phones, for the purpose of making them easier to listen to.

Along with the clearer voice, comes the ability to do speech/speaker recognition over the phone line. Until digital was/is in use, the only recognition that was done was on phones that were connected in-house, (ie. before the line went outside), to a computer.

Once outside, in the regular system, the bandwidth was too small (300-4,000 Hz) and the noise level too high. Digital corrects most of those problems.

I worked in the phone/computer industry about 12 years ago, and it seemed that, at the time, this was the case. But nobody in the industry would talk about it. Those that knew, were probably working with the govt.

I'm sure that the situation with Radio is about the same, just no one has admitted it yet

Congress wants the FCC to sell spectrum to make money. Hence the FCC
is reluctant to *give* new spectrum space to anyone who will not pay
for it (i.e. the public service folks). Hence, the public service
folks are forced to find better ways to manage the spectrum they
currently have. This leads to trunking systems, analog or digital and
a host of other things. This is actually a good thing, spectrum space
is limited, technology isn't.

Exactly correct, they are not going to mess with this "cash cow", would you?

On the other hand, digital cellular offers reasonable privacy from unwanted listeners. Additionally, cell site locations are getting denser which is reducing the coverage footprint from any one site.

I would be careful what I divulge while using an analog cell phone. I do not have this concern running a digital cell phone. Yes, it is possible that my calls could be intercepted using digital, but since it is so much harder than simple following the freq changes of an analog phone, I do not feel this is a real concern. Very few scanner users have the ability to monitor digital cellular, let alone track a complete call.

I do however, agree with the general idea of encyption. If one has a serious concern about ones information security, then by all means, purchase encryption equipment for your phone. To expect a phone manufacturer or the cell carrier to place the additional cost onto the entire user population is crazy. For 99% of the business and private users, digital cellular is private enough.

Personally, if someone is paranoid about using digital cellular without encrption, then they probably have larger problems. The only people who can readily evesdrop on your conversations are the cell carrier themselves, and or the Feds. The carriers probably do have occasional incidents of employees doing this, but generally speaking, they don't becuase they want their customers to feel comfortable.

If the Feds are listening, well like I said... you have got some bigger problems.

:-)

Source record: 136834

The biggest difference is that the 235XLT comes with two batteries, and a stand alone charger, the PRO90 is supplied with only one battery, and the charger has to plug directly into the radio to charge the battery. You can use the PRO90 while it is on the charger however. Also, the PRO90's case is shaped a little different, and has high contrast white line markers on top of the volume and squelch controls.

Put up a tower about 25-50 feet high, and on top of that put a big
honkin' TV antenna. You might just do it, though not very regularly.
I imagine in Houston that most of the FM channels are allocated.
Austin is smaller than Houston, so you might have fewer stations from
which to choose. What's that distance, about 150 miles? It's
possible, but they're not going to be like local stations.

Of course, you could always look on the web radio stations unless you
just want to get it on *real* radio.

Are you looking to just retransmit video around your house? Popular Electronics, Aug. 1995 has an article "Build a $30 TV transmitter". It is based on a kit from Ramsey but you can build your own. The article states it will transmit audio and video about 300'.

I will say in Todds defense, if it is an image, it is the best I have
ever heard. It gets it all and sounds as good as any RS-2006 I have
ever had.

It sounds like you just want to know how, not to buy it.

I do own a BC-9000, and Todd is not lying when he says it will do it.
I do not personally know him.

Source record: 136857

With Hennepin County now going to Digital Trunked...It won't be long until we see scanners at the hamfests going for around 5-10 dollars at the most, since the radio's will be useless for monitoring much of anything much to the delight (I'm sure), of Mr. Paul. Hey, wasn't he fired from the city of Minneapolis ? This guy considers scanners listeners as more of a threat then criminals according to his book..You should read his book that most technical colleges give to there 9-1-1 students for studying..Its pure grabbage!!! My wife brought it home one day from her 9-1-1 center and we both had a good laugh until we realised that this guy is taken seriously in public safety circles...My god!!

25 MILLION for a 800 MHz Trunked System..What a rip-off!!!.They could have bought 5 brand new fire pumpers for every single community on the Hennepin Sheriff Radio System at $200,000 for what this new dangerous and unpredictable radio system costs..It also will turn Hennepin County into an Island similar to Eden Prairie and Bloomington. The Hennepin County Board Members scared the public with false facts and information so that this thing could get passed. "Its for the publics safety!!" Yeh right...Its for a very few selected people to get jobs, make tons on money under the table and to put people lives in danger..Lets face the facts here..Hennepin County Sheriff's Radio is well-known to be the channel HOG in the Twin Cities Metropolitan area...They have more fire frequencies assigned to them them most counties have as their entire combined communications system for police, fire, public works, hospital, security, etc.
Now they claim that they need more!!! I plan to hold each and everyone of the board meets and the jerks that rammed this thing threw accountable when this new 800 Mhz system fails...I want All them to resign their posts and give the taxpayer something back from the 25 million that they just flushed down the toilet in the name of public safety. All it was, was a scare tactic by a few individuals who had nothing to lose but everything to gain at taxpayers expense!!

What a joke :)

It's called SAT (Supervisor Audio Tone). The phone and the site use
it to confirm that they are talking to each other, different cells use
a different SAT to differentiate themselves from an adjacent cell on
the same frequency set. The phone filters the tone out so the user
does not hear it.

Which is exactly why the 202 sales have dropped! YOU don't get it. When
you can get ten times the radio for a few bucks more, why wouldn't you? The
202 made a great run and is just coming to an end. You can bet the RS will
have an HT on its shelves soon enough.
With your logic, CB must be dead. I can only buy one at RS or a truck stop.
I used to be able to get them EVERYWHERE. Must be dying, right?
Take your attitude back to the newsgroups that already got tired of your
crap and told you to get lost!
Our local club is GROWING by about 10% each year. Other clubs in the
Wyoming/Colorado area are experiencing the same. Last time I took a friend
to the testing site in Denver, one of the VE's stated that the crowd of
about twenty or so was not abnormal for them. They are only one of several
VE teams in the area!
Sure is dying! I KNOW BETTER!

I still have the OKI - Ctek- Computer
package deal available.
Take a look at it at

http://home.pacbell.net/kaliber/oki900a.html ....

Its $150 for the cellfone/c-tek and $225 for the
whole package. (including computer) ......
this a postal money order prepaid plus shipping ....
the laptop computers are about 22lbs (ea shipped).
Shipping insurance and 3 day on the oki-ctek is
about $8 and I'll have to check more for the whole pkg.
I will send out the c-tek software library
(via e-mail only ...and only after payment is received.)
I do not include the software and the c-tek together
in the same package.
Reply direct via e-mail

With all due respect, if you are looking for VHF-UHF performance they are a great package, especially with the extra software that allows you WeFax and RTTY, but forget about the HF performance, as has always been the case so far with computer controlled units, it is pedestrian at best.

>>
>> 73, Paul, AA1LL
>> Greenville, NH
>> http://www.qsl.net/aa1ll

The inconsistent chemical mix and production variables within a production run throws all the small sample tests into a cocked hat. On average, large quantity samples, there is not much difference between the major brands. The observation that capacity is related to weight is generally true, the best batteries are always heavy, but not necessarily vice-versa. Some store brands are good buys also, but hard to predict which. Now, about storage. You people up north don't have much to worry about, but here in South Texas, where the night time temperature stays above 80 deg. F all night for most of the summer, refrigeration is a definite plus. Just stay above 32 Deg. F. There are a lot of quirks with batteries. I was involved with a system which used silver oxide watch batteries with a few nanoampere load. So low we couldn't accurately measure it directly, had to use substitution techniques, then the chip was light sensitive, so that further complicated matters. Anyway, under this tiny load, the batteries consistently outlasted unused spares in storage by a life factor of 2. Go figure.
Happy Thanksgiving,
Crazy George

Well said Steve. I have been involved in the design and implementation of a conventional UHF repeater system in the hills and mountains of rural Maine. The system replaced a low band simplex system, and was the best balance of available funds, channel loading, and available technology. Although there is nothing special about conventional UHF repeaters, they are simple and inexpensive to manage and maintain. 800MHz systems require far to many sites here to operate effectively, we don't even have cellular phone coverage in many areas in my county.

My job is dispatcher and technical manager for a county communications center, and I also use the UHF system in my duties as a volunteer fire Lieutenant. I know just enough about communications systems to know when a vendor is trying to smoke me, and with that knowlege as well as some important pointers by various contributors we have managed to put together a much better system now than we had 5 years ago for a minimal amount of money. Maybe we just got lucky, but it sure was a lot of work finding that luck.

I just bought a BC895XLT from Communications Electronics Inc. They have the lowest price I found anywhere and I saw some good posts about them.

I ordered it on a Saturday night and UPS dropped it off on Wednesday. Check out their website. http://www.usascan.com/

Just to let you know- they charge an outrageous $18 for shipping, but the radio is only $194.95, so at $212.95 it's still a lot cheaper than most places. They're also out of Ann Arbor so you may get it even quicker than I did (Philadelphia).

Good luck.

Adam

5876. More Proof that Ham Radio is Dying...Radio Shack Closes Out HTX-202s

Newsgroup: rec.radio.scanner
Date: 1998-11-26 00:00:00 UTC

Just got the new Radio Shack flyer today. On page 35, we find an incredible deal on their famous HTX-202. Only $129.99 while they last. This is not a sale, but a CLEARANCE, and is marked as such in the catalog. I inquired at my local store as to wheher the HTX-202 was being replaced by a newer model and was told "Nope. We're closing 'em out. Radio Shack is discontinuing all their ham stuff." Why? "Nobody's interested in ham radio anymore."

Last year, AES closed their Tampa Bay store. This year, Radio Shack discontinues their HTX-202, formerly a very popular radio. Ham radio is dying. Is there really any question?

A very tall antenna with a nice large TV antenna would probably do the
trick. With conditions lately, I've been DXing all sorts of strange
WFM stations from all around.
This brings up a question, is this ionospheric skip, or ducting?
Anyone know?

Pro-90 Keypad tricks, what some of these do, I don't know.

2,9 Trnk - 'load' followed by scanning bank 1 Loads 19 test freqs..
(This accomplishes the same as 2,9, scan)

2,9 data - does nothing

2,9, l/o - does nothing

2,9, . - displays "H" no keys do anything to change this - except dly
key which when pushed changes "H" to "L" (Only way to clear the
scanner is to turn it off then on again - does not seem to load
anything, although I can't remember if it wipes out any channels or not)

2,9,4 - Displays 1.21 (for a few seconds) Poss a firmware version
number??? Then display changes to E2BFH ... ? Perhaps the TT that have
the ATT function have a different number other than 1.21? (mine is an
older TT - original)

2,9,0 - Makes all display digits light up. Pressing any key loads 19
test freq. (Basically same as 2,9, E)

2,3, Trnk - Loads 19 test freq. (same as 2,9, trnk & 2,9, scan)

2,1, & any key on key board does nothing.

2,4, & any key on key board does nothing.

2,5, & any key on key board does nothing.

2,6, Trnk = (Total scanner reset same as 2,9,MAN)

2,3, Trnk loads 19 test freq (same as 2,9, scan etc.)

2,7 & E - Displays H - Dly Keys changes to L (Same as 2,9,.)

2,8 & E Test display Same as (2,9, E)

ADDITIONAL INFO ON THOSE WHICH HAVE BEEN PUBLISHED BEFORE.....

2, 9, SVC Which brings up the Ct----- Etc.. The frequencies that it
loads are as follows -

(For those who dont want to wipe out their memories, but are curious..)
**Bank 7 (Set to trunking) Fleet map E2
Chan 181 - 867.8375 Chan 182 - 867.8875

Chan 271 - 851.0125

Thats it for what was loaded into my banks.. Some have suggested that
they may be freqs for trunking systems near Uniden factories... Ideas
anyone? Anyone with a freq cd - maybe you could run them to see if
they fit any systems in the US?

Also here are the famous '19' test frequencies
1 - 30.050 2 - 40.840 3 - 49.900
4 - 138.150 5 - 162.400 6 - 173.225
7 - 406.875 8 - 453.250 9 - 511.9125
10- 108.500 11- 118.800 12- 127.175
13- 135.500 14- 29.000 15- 54.000
16- 806.000 17- 857.200 18- 911.500
19- 954.9125

Last but not least the other well known tricks are

2,9,Hold and 2,9,Srch - Loads 300 test freq from 144.0 - 149.98 in 20Khz Steps

2,9,Dly - displays a string of numbers such as 000 0F, 001 00 Etc.

That wraps it up for my keyboard trick investigations, Perhaps others out there will continue to explore and uncover other unknown tricks...

Personally, I've never understood the fascination with monitoring cellular phone conversations. Based on the few cell phone conversations I've heard, most of what's said is boring, routine stuff--husbands & wives discussing problems with finances, the children, etc., and real estate agents discussing the details of selling homes. Cordless phone monitoring is much more interesting. Perhaps that's because people feel more at liberty to discuss any & all subjects at length because they're not paying for airtime, or because they think their coversations can't be overheard. Set your scanner's search limits for 43.720 and 46.970 MHz and try cordless phone monitoring for a change ;).

>>CBs don't cover a great deal of area without screwing up my radio/tv
>>reception.
>>CellPhones cost cash. Ham radio is the only "cheap" alternative. Unless
>>there is
>>another communications device that is going to replace it.

1. FRS (currently RS has single-channel units on sale for $39 each),
2. Most cellular carriers here have cheap plans that include 500 or
more off-peak minutes. Example: AirTouch Cellular has a $19.95
Powerband Digital plan that includes 40 peak minutes and 1,000
off-peak minutes. My AirTouch analog plan has 20 peak minutes and
unlimited night and weekend calling for the same price. Both plans are
VERY good deals. If your credit is screwed there are also those
prepaid cards.
3. Paging service is dirt cheap here, like around $4.99 a month with
some providers.
4. The Internet (duh!)
5. Good old home phone service

All these options are, IMHO, much better than depending on ham or CB
for anything other than low-power, simplex communications that are
harder for jammers to intercept and interfere with. Also, you won't
have to watch every word you say on the air like you do with ham, you
will have a greater degree of privacy than you will on ham, you won't
have to get a P.O. box just to avoid having your home address posted
all over the Internet on those damn callsign servers, and you won't
have to deal with whining yuppies who will shut their repeaters off on
you just because you don't think exactly the way they do and lead a
boring yuppie life. If a repeater owner is not an elitist pig and he
welcomes all hams, his repeater is labeled a "dirtbag" repeater. HF is
an alternative if you live where you can put up good antenna systems
and you can afford the thousands of dollars in equipment it would take
to overcome all the noise from power lines, flourescent lights, etc.
And of course HF is NOT a practical choice for handheld use. When I
had a CB base station I was accused of bleedover when I wasn't even
home, so I really don't want to deal with that ever again. You all
know that that is a problem a lot of CB'ers go through, hence all this
stupid anti-CB legislation being passed recently.
Bottom line; I use ham only when there is no other way to reach

somebody, and I use the lowest power I can get away with (50mW on an Alinco DJ-S11--can't be interfered with when you're standing 500 feet away from the repeater site, or you're on simplex at very close range).

Signed,

A ham who is sick of all the ?&$%

All,

As you sit down to that overladen dinner table this afternoon please remember that all around the world there are American military men and women who aren't sharing this holiday with their families, but by their absence they are insuring that the rest of us can have a safe and happy holiday with our friends and families.
Remember, too, that you don't have to look to foreign lands to find these heroes. At the fire house down the street, or in the patrol car cruising your neighborhood, are folks who would much rather be home watching football on the TV but who have chosen to put the rest of us ahead of themselves.
God, bless them all.

John & Paulette Ward
Brandon, Florida USA

Here we go again...

The Internet is going to solve all of our communication problems.

Yeah, sure it is. I'll soon be replacing my trusty 70cm mobile in my car
with a laptop so that I can "talk" on the Internet while I'm on my way home
from work. That's is of course right after I set the autopilot so I can
have both hands free to type on the keyboard.
Gee, can you use the Internet to call in an accident? How 'bout when the
car breaks down 60 miles from noplace and there's no cellular coverage?
How about when there's an major earthquake or flood? Amateur Radio will
still be working when the Internet will not.
Yep, the Internet is going to replace Amateur Radio and fulfill all of our
communication needs.

Yeah, right.

Dan

Hey You, anonymous TailGator,

What you forget is that a post on a newsgroup should be
informative to others, or a request on information.

What you are doing here is just bashing, blowing off your
frustration of purchasing (at your own initiative!) a scanner
which apparently does not fit your need, or you are unable
to turn into your profit.

Why, do you think, thousands and thousands of IC-R10's
have been sold? Why do police departments purchase
IC-R10's by 100 or more?

Did you just buy the scanner without inquiries on how it
works, what you can expect from it, discussing with others
on what you may or may not expect from such a device?
Did you just give your money for something you didn't
know what it is?

If that's the way you spend your money, frustrations will
be your part. But don't bother us with them! Get educated
and learn how to buy things. First evaluate, then spend.

Hope you learn from this ... Fabrizio.

By the way: iCOM IC-R10 is not my favorite scanner either,
but I purchased it to see what is in it (after evaluation), not
to expect heaven and blow off my frustration to this NG
when finding something different than heaven.

TailGator wrote in message <365C8F1B.29E9@ix.netcom.com>...
|Just got the Icom R-10 scanner and have to say that after sitting down
|with it for over and hour I am not impressed, nor do I like it very
|much. Guess I'll play around with it until they rework the 8200 and
I'll
|try that one. This will suffice until then - and if all else fails I'll
|go back to an 8000. This Icom just don't get it, though. Too much of a
|pause delay and the programming is too complicated. I am having a
|heckuva time containing the scan to particular banks...it just keeps
|going to the other banks...how the heck do you lock out a tone
frequency
|- you have to engage SKIP? Not even gonna bother with the computer
|control. I am disgusted with this one..better luck next time
|
|Should have tried the Alinco maybe...:(

And if you don't use the proper term at the proper time and speak it in the
proper manner, be prepared for a stern lecture from the local repeater cop who
has no life outside of amateur radio.

> you
>will have a greater degree of privacy than you will on ham, you won't
>have to get a P.O. box just to avoid having your home address posted
>all over the Internet on those damn callsign servers

And if you DO use a P.O. box, or other alternate address, be prepared for the
above-mentioned repeater cop to accuse you of being in violation of FCC
regulations. Damn idiots cannot seem to read Part 97 and understand the
difference between "valid mailing address" and "physical station location."

>and you won't
>have to deal with whining yuppies who will shut their repeaters off on
>you just because you don't think exactly the way they do and lead a
>boring yuppie life. If a repeater owner is not an elitist pig and he
>welcomes all hams, his repeater is labeled a "dirtbag" repeater.

And if he isn't a code-preaching, ARRL-worshipping, "real ham", he will be
labeled as a "CBer" (and worse) by other hams who fit the previous description.

These are the reasons why I decided to sell all my equipment and get out of ham
radio. Used the proceeds to buy something useful for personal communications
in 1998...a newer, faster computer. Couldn't be happier. I would suggest that
others do the same.

"Where's that big 'ol CB RAMBO??"

That's what a cellular phone is for. Another modern-day invention that you
HAMBOS refuse to accept. Gee, I guess they should require Morse code
proficiency before activating the phione, eh?

>That's is of course right after I set the autopilot so I can
>have both hands free to type on the keyboard.
>Gee, can you use the Internet to call in an accident? How 'bout when the
>car breaks down 60 miles from noplace and there's no cellular coverage?

Wake up! It's nearly 1999. Unless you're in a extremely desolate, deserted
area, you will have cellular coverage. And if you're foolish enough to go
somewhere like this by yourself...well, you'll need more than ham radio to save
you. The likelihood of you having cellular service in such a location is
greater today than the chance of you being within range of a ham radio
repeater.

>How about when there's an major earthquake or flood? Amateur Radio will
>still be working when the Internet will not.

But alas! There will be nobody still alive who can understand your Morse code
messages. Too bad.

Excuse me, but what Radio Shack or K-mart does or doesn't decide to sell does not mean much. Aside from the guys who "cum in their pants" when they get a new Rat shack catalog or flyer, the rest of us in the world don't revolve around Tandy Corp. There's a lot of stuff radio shack starts & stops selling, Audio, Video ect, and it's more of a corpoate decision than anything else. It seems to me that Maxon probably doesn't have the capacity to continue making Amateur equip for Tandy, Tandy is satisfied selling Ham stuff thru their TECH AMERICA chain, and it must be hard to find other MFGRS to r&d and produce a private label rig as cheaply as Maxon did. Companys like Radio Shack are, "listen up pants' cummers" IN IT for the money. One year or two it may be "computers", then for a few years sattilite TV stuff, then they drop somthing to expand on radio control toys or whatever. They made good money on the HTX-202, now it's getting old & stale, people want to upgrade & they don't currently have anyone lined up to produce the next "realistic" HT. Remember AES, HRO & your local scanner/ham store. They stick with the hobby year after year & don't "gut" their stores every couple of years to jump on the "sprint phone" , "electronic toys" or "TV market " bandwagons. Keep them in business, we in the hobby need them. Radio shack will always be there & is great for buying parts adaptors & batteries., & mabey they'll be "moving" bread machines or whatever in a few years, but the real hobby stores are the true heroes & need our support. I guess I'll "cum in my pants" when the next one opens in my neiborhood! .....just 2 cents worth...

The Internet and cellular may not fulfill all the roles of amateur radio,
but I'm afraid they will eventually siphon off enough users to make continued
production of new radio gear cost prohibitive.

I COULDN'T have said it better myself!! Let radio shack remove
military air from all their scanners like they did this year, it doesn't mean
to the "rest" of us that air monitoring is dead, only to the morons that can
only buy a Realistic scanner. They haven't had a base CB with sideband for
years, I guess all the CB hobby guys on sideband all died too. HF & 6 meter
ham must have been buried years ago because the almighty "radio shack" does not
sell that stuff either. AT & T must be a very tiny worthless dying company
now, because RADIO SHACK now sells Sprint ......

You don't get it. The significance here is that the HTX-202 is by far the most popular amateur radio in the world. The fact that Radio Shack has decided to halt production of this radio means that DEMAND is down substantially. Less interest in ham radio = less units sold = less profit for Ft. Worth.

When Radio Shack dumps the HTX-202, it doesn't take a genie with a crystal ball to figure out that there's something seriously wrong with the hobby.

I have the RS PRO-2042, and it DOES have 800MHz - just no cellular. Freq range is 25MHz thru 1240MHz (less cellular). Just keep in mind that when you're scanning a number of frequencies you know to be active, this is quite different from "trunk tracking". Things get a little weird when you're trying to follow several trunks AND scan a bunch of known frequencies.

Paul

Because their HTX-202 is by far the biggest-selling amateur radio in the world.
If they are stopping production of these, you better believe there's a BIG
drop in demand for amateur radio equipment.

The HXT-202 has been around for almost 6 years, if sales are down it means that the 202 is finally at the end of it's great run, everyone who wanted one got one, not that the entire hobby is dead. The first few years it was out they had this enormous "pool" of hams all existing ones as well as newcommers, and dual band HT's were $500-700 bucks. Now dual banders are under $250 new and most of that big pool already bought a 202. Radio shack has no follow on product for "uopgraders" People w/a 2M ht look a dual band mobiles. Today i think most hams are gettig dual banders, because it's only a 25-75 dollar difference in HT's. I'm sure Yaesu for example sells more FT-50's than FT-10's. $260 for a '50 w/the 5W battery. If the 202 wasn't on closeout price what would it be? Around $200? Also the 202 used to be the "cheapest" 2M radio, now you can take your pick for between $120-170, and I'm not even counting the $99 5W DJ-190 tech america sells or the $88 buck half watters. ALL these factors have just as much or more to do w/ the 202's sales than the "death of ham radio"

Your best bet would be to get a directional antenna tuned for that exact frequency and put it up high - on top of a tall building or tower. You might need to add an amp to the incoming signal. Use a sensitive tuner and point the antenna in the direction of Austin and you should be good. Of course, if you are just to far away, it just won't work no matter what you do. If my mind is right, Houston is quite a ways away from Austin, isn't it? Another thing that'll mess you up is if there is another radio station on the Austin frequency closer than Austin is to you (say in the oppostie direction). I'd suggest getting some more opinions before you spend a lot of money.

Because RS CB equipment was largely inferior to what was available elsewhere in the market. As a result, sales began to drop off dramatically after the word got around. In addition, their radios were way overpriced...as is the case with nearly all RS merchandise. Who's going to pay $199 for a Realistic SSB mobile when a Cobra 148 GTL can be had for $150?

rshanna@aol.com (RSHANNA) wrote:

>If you are trying to decode 900MHz pages they are most likely FLEX protocol.

NOT TRUE! There is still plenty of POCSAG traffic on the 900 MHz
paging channels. In this area (SF Bay Area), for example, Flex is
growing but still not 50% of total traffic.

>This is a TDM protocol which in no way shape or form resembles POCSAG or GOLAY.

I beg to disagree: Flex is quite similar to POCSAG - identical in
basic transmission (FSK), both are multiple frame formats, etc. Main
differences is that Flex is a synchronus format (POCSAG is not) and
the faster Flex transmission rates use a 4-level FSK instead of
2-level.

One thing is correct: GOLAY has almost totally disappeared from the
900 MHz band: its throughput rate is too slow and POCSAG pagers got
too cheap for GOLAY to survive.

Message-ID: <365c9ade.0@d2o47.telia.com>
Source record: 136980

Well, read the manual..... you will find the answers there.
Is 2 sec a long pause??? it is so long if you choose pause instead for 5 sec
or 10 sec.
I have had my R10 for a week now and it is better than my welz ws1000.
It is a little slow on scan speed, but you can&#65533;t get all bells and whistles
...
And with the CS-R10 software it is easy to programme it.

so why are you yelling , if you dont like it so what? I don&#65533;t care. We
don&#65533;t need to hear it.

I don't get a commission or anything, but just in case you didn't get this spam from Bandercom, check out the price on the Yupi 7100 (that's a helluva good scanner for under three bills):

http://www.bander.com/export/xmas.htm

AR-8000 $369
MVT-7100 $269
AR-8200 $529

many many more.. Scanners, HAM and CB Radio.

If you would like to receive your copy of the X-mas Specials by e-mail, simply reply to this mail.

NEWS and latest additions:

Icom IC-R2 $240 (December 3)
Alinco DJ-X10 $299 (Mid December)

Hi

>However, it would be nice to have a manual and/or schematic for the
>thing. If anybody knows of a source, pointing me in that direction
>would be welcomed!

The manual for the AR2001 would also be "compatible" with the MX-7000.
Only difference being the MX-7000 has the 800-1300MHz coverage lacking
on the earlier AR2001/MX-5000.

All functions are the same.

Its not quite the original manual that came with the radio but there is
now a "help sheet" available that will probably get you by on the AOR
(UK) Web site.

http://www.demon.co.uk/aor/manuals.htm

Have fun.

Hi Ed:
You should really attend the meetings with the radio communications groups from both the Minnesota and Wisconson. We have meetings twice a year with many members attending this events. Most of the meetings are held on a sunday in either Madison or Milwaukee Wisonsin. There is a group from the Minneapolis area that car pool to these meetings. We go and come back in the same day. The amount of valueable information and knowledge at these meetings is incrediable and well worth the time to attend. Also, there is a large group of us who talk on the 145.370 machine about scanner listening. Think about attending a meeting sometime.

Well, you try to program a cell frequency, like 875.0, and if it says Error, then it is blocked. There really isn`t any simple way to unlock it. This does not mean it is "inferior" in any way. It is really quite a good rig.

You can tell when you attempt to enter in a frequency within the blocked range.
Something within the 870-894 MHz range would show this.
You will probably get an error display.
Hope this helps you.

Source record: 136690

I just bought a BC235 from Scan USA. I ordered it over the phone late Sunday evening and it arrived Wednesday, just in time for me to play with it all day Thanksgiving day

So far everything works great ! Their price was only $169.95 plus $18 s&h.

I first bought a RS Pro-91 when it was on sale for $169.95. Then someone in this news group mentined that SCAN USA had a website and was selling the BC235 for the same price and it of course has 300 channels compared to the Pro-91's 150 channels. The BC235 also came with 2 recharble batterpacks, the ac adapter / charge and an earphone. These would have all cost extra with the Pro-91.

Needless to say I returned the Pro-91 for a refund this morning.

For more info on the BC235XLT checkout the Scan USA website at:

www.scanusa.con

No, I am not connected in anyway to this company. I just liked their price and their quick service !!!!

After listening to it, I dont think its a precinct at all. It must be a general emergency dispatch freq. In the last hour they mentioned East 25th Street, Harlem river drive, and east 96th street. each of these locations have different precincts. whatever freq they are using, it's a good choice because it's covering a lot of preincts at once. hope this helps

I was wondering if following trunked systems with a regular conventional scanner is practical to do. I've heard that you can program the known trunked frequencies into your scanner and then have the scanner scan automatically when a transmission moves, but are there any disadvantages to doing it this way instead of having a real Trunk Tracking scanner? And is living in NYC a problem? Like could having too many active frequencies in a place like where I live prevent you from following a trunked system effectively?

5956. Re: Trunk Tracking- How many seconds usually pass before trunking to other frequencies?

Newsgroup: rec.radio.scanner

Source record: 136702

With the system i listen to here, if there is no response on the ID for about 5 seconds (no transmission) it goes inactive until another transmission is made. There is really no set number of seconds during transmissions...just between transmissions...it doesnt jump to a new frequency during transmissions.......
(maybe that doesn't make sense...)
if the dispatcher calls call 54 and he answers right away (within a couple of seconds...) his transmission to dispatch will be on the same freq that the dispatcher was on. If car 54 doesn't answer in those first 5 seconds, it will switch freqs....make sense?
This is just talking from experience...no formal education here...but i listen to the county police etc on a trunked system just about daily and this is what i hear......

Bill Cheek has a few left. He is selling them for $250. His website
is located at this link:

http://ourworld.compuserve.com:80/homepages/bcheek/

The "cell mod" can be done with a single snip of a diode for
this radio. Instructions for this are posted all over the net.

B. The ham radio. Satellite work is done all the time using radio. By the way, satellite phones are radios. I'd save a lot of money, allowing myself to buy a good antenna, and still be able to do the same things.

> Case closed.

What case? In fact, what joke?

> So people can use them illegally on their new, hot-selling FRS radios.

Sure - if they're able to plug them in, but that won't happen. The simplex RC works only in radios equipped with a 3/32" PTT jack and a 1/8" speaker jack. As far as I know, FRS radios are configured differently. Headsets can be used, but most (if not all) FRS radios have a single jack with a 4-conductor audio cable.

NO most FRS radios including all from Cobra, Midland, Alinco, icom,
Cherokee & many others & some of the motorolas all use the "standard" 2 hole
1/8 spkre and 3/32" ptt. In fact there are a very few only that use any "odd"
connectors Yaesu is one but the make an adaptor

Mike

5979. FS: AR-8000 w/ computer interface

Newsgroup: rec.radio.scanner
Date: 1998-11-27 00:00:00 UTC
From: slogan@northlink.com
Message-ID: <slogan-2711981813520001@pm4-21.northlink.com>
Source record: 136725

I have a full coverage AOR AR8000 in mint condition to sell. It comes with the following:

1) Scout jack

2) the AM filter mod

3) the cellular filter mod

4) leather case

5) vinyl case

6) wall charger (110 vac) & nicads

7) 2 battery compartment doors, regular and with computer slot

8) Descrambler Chip

9) CX 12 AR Computer Interface

with manuals, box, and stock antenna. The radio is in mint condition and shows no wear as its always been kept in a protective case. Originally a Javiation UK unit it has the US band-plan with unblocked frequencies and the mods were professionally done.

$500.00 plus shipping. Buyer to prepay, have lots of references

Thanks!

Stuart Logan

Source record: 136783

CBRAMBO QUOTE:
>why didn't RS introduce the
>"replacement" BEFORE discontinuing the 202? Hmmmm?.....

> Because unlike clock radios & phones & car stereo amps, almost no one MAKES ham gear in the orient that is not already distributed in the US. Tandy buyers shop the orient to "private label" wares that are produced there. Companies like ICOM , kenwood ect have exclusive deals w/their American divisions that precludes them from making anything for radio shack. MAXON doesn't build any other ham gear except the RS stuff, and that doesn't leave any other mfgrs to buy from . R & D costs a lot of money & takes time. perhaps we will see something new from RS, But you act like GOD works for tandy with stupid quotes like "Well then why didn't radio shack do this or that" Everyone else's opinions can't be true because "Radio shack" didn't already think of it or know it or do it? When they do come out with a new piece of ham gear you'll be telling everyone how "HAm radio" is now "back" because "THEY" are now selling one HT again . MAN, if tandy corp were a cult it sounds like you would be first on line waiting for the UFO with the cup of cool-aid in hand.....

I tried RS and they will not let it out since the pro-90 can be
modified. Ditto for the Uniden 235.

Actually, there are scads of companies turning out radios for the
private label market.

Radio Shack just got out, because they don't see a market for what
they can offer. Simple

Yes, Canadians love to repeat that it's legal in Canada to monitor ANYTHING, as though it were some sort of protective mantra against the realities of Canadian law. However, it is in fact true that possession of digital scanners WILL require the issuance of a permit by the government, whenever somebody actually starts making digital scanners. If you have doubts, go to the NF2G Scannist Pages - Ontario Section at http://www.nf2g.com/scannist/ontario_index.html and click on "Laws & Regs" and read up on the facts.

Possible? Yes. Easy? No. Not worth the effort. No simple
mods for this. If this radio doesn't already cover a specified
frequency band, you aren't going to get it. Plenty of used
scanners out there though. To see what bands they cover
and some possible mods, visit this link:

http://w5gb.nmsu.edu/kc5kto/mods.html

I take a printout of the scanner specs from his page when I
go to a Hamfest, garage sale, or pawn shop.

Keep in mind no one scanner does everything well. That's
why many of us have several. I have 5 and working on a
deal for #6!

Hi Kenny,

Do you think that some 80 Million people capable to speak German
have only few radio enthusiasts among them?

Or do you think that there are only very few people that do *ONLY*
speak English and no single other language, either as primary or as
secondary language?

The fact that YOU did not take the effort to get better educated than
in your native language only does not mean that you can assume the
whole world to be so short sighted ...

More people have Chinese as their native language than there are
people WORLDWIDE that speak English as their primary or secondary
language together ... widen your horizon!

Viel Spa&#65533;, Gl&#65533;ck und auf Wiederh&#65533;ren,

Fabrizio (nein, nicht gerade aus Deutschland ...)

What I'd like to know is why someone doesn't cook up some adapters so lithion ion batteries can be used instead of AA's. Like if phones & camcorders can go for hours, then a "passive" scanner should go for days on a charge?

Why are we stuck with AA's???

Perhaps the 202 is not avail anymore or soon in certian US states or cities , however in the recent Canadian flyer , no mention of any 202's.....maybe they are dying in sales..HAM will alway be there...however in smaller centers , ' CERTAIN ' HAMS like CB'ers can kill off a hobby in a few short yrs , such was the case with VE3 GMI...he managed to kill off 45 hams in a one club (Started in 1958) in 3 short yrs...ppl just turned off thier rigs , cuz of one jerk.

Perhaps HF is where they are...Dunno..I too gave up on HAM / CB...too bad too..loved both very much , and after 25 Plus yrs at it...kinda sad to see it go this way...as far as CB...a nice local club , approx 8 yrs old was killed off by Ken Hope ...new HAM CALL VA3 KWH....he killed off CB in no time..Funny tho...both are good friends!

Back to the post , I think Mr. Ward summed it well in a past post...

```
phoneline antenna for mw&sw
phoneline
red .01uf center cond rf connector
or+-----//-----------------------------------------------+
green 50ohm coax cable
ground-yellow-------------
-------------------------+
shield
no ground connection if reception is poor
you must use a .01microfarad
capacitor to keep line voltage from overloading your radio when the
phone rings. and your reception will be best if you have
above ground phone lines
it will still work fine with the amount of wall&attic.wire thats in an
apartment
if you have underground lines.
```

Hams have communicated via satellites with low cost gear for many years. Sorry,
I'm afraid I don't get the joke.
Best regards,
Dave

if you have a 2 year old model of
radio shack 800 mhz scanner dont sell it.
if you can believe this, the fcc has passed a law that will make it illegal
to
sell or listen to a radio that scans over unscrambled mobile phones.
why dont the companys who make cel phones block it out?.
.
i think our govt is creating another crime.

I would like to avoid shipping my scout back to opto for a battery change. Has anyone tryed using a cordless phone battery or such with any luck. It's been a while since I've had the case apart but I'm guessing it's just a 6 volt nicad pack. Hope to find something that fits the space and will work electrically. Any advise?

Terry

download mediaplayer 5.2beta go to www.broadcast.com
if you know the station frequency&
call letters you can enter them into
the computer and listen that way
.
i dont know how far you are from austin.
i know its flat like texas where i live so i know you can recieve a 100,000
watt fm
station at least 70 miles if you have one of those optima indoor antennas like
i do.
houston is huge compared to my town they should have stereo broadcasts on
cable tv if you live within the city limits.
.

6025. Anyone need a BC120XLT user manual?

From: Shaun Whitman <lstrain@email.msn.com>
Message-ID: <uZJMUugG#GA.332@upnetnews03>
Source record: 136821

Anyone want a BC120XLT users manual. I don't have this scanner anymore and have no use for it. First email gets it. Its FREE, I'll pay the $.32 postage. I figure that there is somebody out there that could use it. It also can be used for the BC220XLT. The only difference is that the BC220XLT has 800Mhz and 200 channels.

From: fbals@aol.com
Message-ID: <19981127094951.02550.00000889@ng57.aol.com>
Source record: 136824

Since I haven't had any inquiries on the BC3000XLT, I have decided to drop the price to $250 plus shipping. Again, it's in mint condition, hard to tell from brand new, and works perfect. All accessories except original box. Coverage is 25 to 1300 Mhz.

It DOES receive cell phones in the 1005-1050 MHz range.

Email: Fbals@aol.com

"Right on dude"

I've been stupidly continuing an email thread with clueless "007". Why is he clueless? Because he has absolutely no grasp of the amateur radio concept. Building antennas, your own radios, using them in emergencies, packet, simplex, propagation, electronic theory, I could go on and on.

Then this guy, 007, emails me CBRambo's post stating the end of amateur radio is starting with Radio Shack's HTX-202 closeout. How rediculous this is. Yes, it may be a popular *handheld*, but so? Mobiles and other handhelds are much more widely used. The alleged end of amateur radio does not depend on the discontinuance of a single HT.

Prove to me amateur radio is dying. Try getting to know something about it before your useless posts.

Ouch. What an argument 007 has.

Anyone know if you can hear these frequencies using conventional scanners or do you need a trunktracker.

6034. Re: Hennepin Co. (MN) Going to 800MHz Trunked

Newsgroup: rec.radio.scanner
Date: 1998-11-27 00:00:00 UTC
From: rsmtmn@aol.com
Message-ID: <19981127103858.11592.00001397@ng42.aol.com>
Source record: 136830

Minneapolis withdrew from the 800Mhz along with: St. Paul, Ramsey Co, Dakota Co said from the start the they will refuse to participate now and in the future. Looks like the only ones who haven't figured out that is a total waste of money is Hennepin County and Carver County.

Ever been to the local APCO Meetings? I was a member along with my wife for 7 years. Its totally run by the commercial vendors and the directors/supervisors of 9-1-1 centers who don't know the first thing about radio operations. But yet these same9-1-1 directors/supervisors are the ones proposing this million dollar junk on the advice of the commercial radio vendors. There is huge amounts of money under the table on this 800 MHz Trunked System for Hennepin County.. Its not needed now or in the future for the Minneapolis / St. Paul Metro Area. As far as the Brooklyn Park Fire Chief saying that he can't communicate with his fire personnel on the present radio system. He is only trying to scare people with him comments in the Minneapolis paper. Hennepin Co. Sheriffs Radio has 5 fire channels. One dispatch and the rest for truck to truck and other ops. This is NOT counting the 2 Mutual Aid and 1 Fire Ground (Tactical) channels which number an additonal 3 channels, bringing us to a total of 8 fire channels available for use by hennepin co fire crews to use. This chief has no idea what in the heck he is talking about...And if he knows this little about his fire radio system, its scary to think what else he doesn't know about in regards to his own brooklyn park fire dept. If I was a volunteer on his dept, I would seriously question his decsions after his wild statements in the minneapolis newspaper. wow!!

I recently won an auction on eBay for the charger/battery set. Now
I noticed the same person has another auction up with many sets of
batteries and chargers. I couldn't find these batteries anywhere
here (no Costco) and felt lucky to find them even cheaper than what
people posted they were at Costco. Go to www.ebay.com and search for
"panasonic nicd" and that should pull up the auctions with these
batteries. I know a good number of people here were looking for these
and I hope it helps you guys out..

6050. http://www.usascan.com has your free scanner owners manual

Newsgroup: rec.radio.scanner
Date: 1998-11-28 00:00:00 UTC
From: Ken Ascher WB8LIT <cei@mediaone.net>
Message-ID: <3660C91A.3829EAFF@mediaone.net>
Source record: 136594

As a service to our scanner owners, Communications Electronics posted the entire owners manuals for our most popular scanners and other products we distribute through our dealers in the public area of our our website. The URL for your free product owners manuals is http://www.usascan.com.

To access the current on-line owners manuals, you must go through our home page, then, for scanners, select the "Bearcat scanners" button on the left side, then select the scanner with the attached owners manual documentation.

If there is enough interest from other scanner owners, CEI can add other owners manuals and scanner documentation to our public web site. Therefore, your individual input is very important to us as it helps determine which products, services, features and benefits Communications Electronics supplies to our dealers and customers anywhere on the planet.

As an authorized Master Distributor for Uniden products, it is our responsibility and pleasure to help all Uniden customers get the products and services they desire. Sometimes your local Uniden dealer might have owners manuals in their store for our products. To find your local Uniden dealer, call the dealer locator line at 1-800-297-1023 and follow the voice prompts.

The e-mail we receive from all scanner users helps us determine what new products will be made available in the future as well as what information and products are featured on the CEI web site. We added the owners manual feature to our web site because one customer bought a used Bearcat Sportcat 150 last week and asked for a manual through this newsgroup.

As thousands of people have successfully downloaded our owners manuals you might want to try using a different computer. As our web site features many different scanner owners manuals on-line, try to download some of the other PDF files and send us e-mail to cei@usascan to tell us if it worked (it should). Some of the manuals are over 60 pages long so you might want to preview them on your screen before printing. You can also print selected pages using the Adobe Acrobat reader.

Remember, most of the owners manuals also contain the official factory warranty policy. We believe it is important for you to know how the product works prior to purchase. It helps reduce unnecessary calls to the factory customer service center and help you to maximize the benefits from the products we distribute.

If after reading your owners manuals from our web
site, if you have any additional questions on how the product
operates, feel free to contact the manufacturer. The toll-free
factory customer care number for all our products is on
each product page in our web site. But, please, above all:
Do consult your owner's manual first. There are many sketches and
diagrams which usually lead you directly to and quickly to a
solution.

Thanks again for picking up one of our scanners. Your business is
important to us and our dealers.

Does anyone know what protocol LA County Sheriff uses on there MDT's??? I finally have the freqs (Thanx Mike) but I'm still unable to decode them with MDT Monitor for windows. I've heard that LA County dosent use MDT 4800 but any more info would be great. also if anyone in LA County has sucessfully scanned the Sheriff's MDT's.

thanx

timberwlf@earthlink.net

That will last about a year or so until the present incarnations
of Dick Bash steal the questions and answers one at a time,
just like it was done 20 years ago. You can't unring a bell.

A better solution is to have _sample_ q&a published, and for
the actual exam use a randomization program to change the
parameters and/or the situations that make up the body of the
question(s).

>myself to buy a good antenna, and still be able to do the same things.
>
>> Case closed.
>
>What case? In fact, what joke?

Well, let's see:

IRIDIUM Satellite phone:

1) Encrypted Digital System
2) Handheld in the palm of your hand
worldwide digital communication to and from any point on the globe, airspace,
or space.
3) Caller ID, Caller Waiting
4) Approximate 75 satellites in low-orbit constellation ensuring constant
connectivity
5) Doubles as a Digital PCS cell phone

Now, let's take a look at the better features of HAM radio:

1) cheaper

Looks like 5 -1, IRIDIUM wins.
And, try setting up your ham antenna on a
rubber raft in the middle of the Pacific Ocean, while I nonchalantly take out
my IRIDIUM from my shirt pocket and make a call to the other side of the world
while I'm watching you set up. Now, THAT is the joke.

> 1) Encrypted Digital System

So? If it's encrypted, it can certainly be decrypted.

> 2) Handheld in the palm of your hand
> worldwide digital communication to and from any point on the globe, airspace,
> or space.

Yep - there are handheld "ham" radios, too, you know. Worldwide communication using a helical antenna, radio, and the satellite.

> 3) Caller ID, Caller Waiting

So? I don't need to know who's calling. However, some reverse autopatches I've read about do tell you who's calling, and can let you know if you've got another. This is very easy to perform.

> 4) Approximate 75 satellites in low-orbit constellation ensuring constant
> connectivity

Many more than that for amateur satellite work.

> 5) Doubles as a Digital PCS cell phone

Why would I use PCS if it isn't present at all in most countries. Amateur radio is present in many of the world's regions. PCS in Antarctica? No. Amateur radio capable of email, telephone calls, and more in Antarctica? Absolutely YES.

> Now, let's take a look at the better features of HAM radio:
> 1) cheaper

I can add much to that:
2) much more widely used
3) can take or receive telephone calls (called reverse autopatch)
4) can send and receive email with just a laptop, radio, TNC, and antenna.
5) more fun (more functions than just calling people)
a. Around the globe with 5 watts and a not-so-big antenna
b. Can communicate with anyone - even if they speak no word of English
c. Can easily communicate with satellites with surprisingly very small antennae.
6) Won't go dead when satellites and cellular/PCS towers and systems do.

> Looks like 5 -1, IRIDIUM wins.

It might look like that, though you probably need your vision corrected.

> And, try setting up your ham antenna on a
> rubber raft in the middle of the Pacific Ocean, while I nonchalantly take out
> my IRIDIUM from my shirt pocket and make a call to the other side of the world
> while I'm watching you set up. Now, THAT is the joke.

No joke. There are antennas that are as simple (and the same) as the very antenna that pops out of your phone: Helical antennas. Just this single "ham antenna" can easily transmit and receive to/from satellites.

How is a small phone fun? Do you learn anything about electronics? No. Can you talk to someone who doesn't speak English? Not unless you speak their language.

Who needs a repeater? Try a satellite.

> But alas! There will be nobody still alive who can understand your Morse code
> messages. Too bad.

Morse code isn't required for communication around the world with amateur radio. It's nice, but SSB/phone satellite work is popular.

6074. Re: Trunk Tracking- How many seconds usually pass before trunking to other frequencies?

I have decided that I don't give a damn what others think of Ham Radio. I love it. I know many others who do. The likes of you I'd rather see on 11m, which I hate. But, that is me and to each his own.
While you sit around and preach the death of Ham Radio, I'll be out enjoying it. Have fun with your "DX"!
And for those than imply hams have no life, GET ONE YOURSELF! The most socially unskilled people I have ever met around here troll on 11m, wishing they could muster the effort to study for, and pass, the Ham exams! For me, the fact that CB'ers (that's not ALL 11m operators) are not on Ham freqs is motivation enough!

Hi,

I just picked up a BC-9000 and I don't have a manual for it.

Where to get one?
Will pay copying costs or will copy and return.

Stupid question how many conv freqs can be programmed? The ad in the radio shack book says 150 channels (trunking?) and you can search up to 300 channels? Can someone clear this up for me.

Bill Cheek's S-Meters for Scanners
Frequently Asked Questions File
==========

Contents
=========

01: My CB, Ham, and SWL radios all have S-meters. Why not my
scanners?

02: How can I add an S-Meter to my scanner?

03: How about an S-Meter for the PRO-26?

Questions and Answers
==========
01: My CB, Ham, and SWL radios all have S-meters. Why not my scanners?

Derned if I know. My guess is that the superficial reason is one of sheer economics. S-meters add to the cost of the radio. Deep down, I suspect that the majority scanner market consists of homebodies, yuppies, and couch potatoes who really don't know an S-Meter from a speedometer, and who wouldn't appreciate one if they had it. So the manufacturers don't provide S-meters on any but the top end scanners.

An S-meter can be added to many scanners, though. <grin>

==========
02: How can I add an S-Meter to my scanner?

Some scanners, notably most Unidens will require a procedure that I haven't written and fully tested, so all I can tell you about right now is how to do it to certain kinds of scanners, notably those manufactured by GRE-Japan for Radio Shack. This technique might apply to Uniden and other scanners, but I can't say for sure at the moment. Read on and maybe you can find out for yourself.

HIGH PERFORMANCE S-METER FOR THE
PRO-2006/5/4/3/2 PRO-2035/2042
PRO-2041/2032/2027/2024/2022/2021/2020
PRO-64/62/44/43/39/37/36/34/32
and possibly other scanners with the 108-136 MHz Aero Band
Revised 11/28/98

==========
PRELIMINARY NOTE: This article is self-contained and you really don't need any other supporting materials other than the service manual for your scanner. Bear in mind, however, that only so much detail can be in an ASCII text file like this. If you want more detail than offered here, a hard-copy laser printed version of this article, complete with professionally rendered graphics is available for US$5.00, ppd. See my sig box at the end of this article for addresses, phone numbers, etc.
==========

INTRODUCTION:

What is an "S-Meter"? Well, it stands for "signal meter" and is used to provide an "RSL" (received signal level) indication of the strength of the incoming signal. Analog S-Meters are all calibrated pretty much in the same fashion with two scales. The first 2/3 of the metering range is calibrated in "S-units", a fairly linear scale of 0-9. The units are read as S1, S5, S9, etc. S9 is the calibration point, generally meaning a signal at that strength is 100-microvolts, but manufacturers sometimes use 25-uV or 50-uV as the reference for S9 signals.

The relative signal difference between S-units is typically 6 dB per S-unit, between S0 and S9, but in practice this can vary widely, from as little as 3 dB per S-unit to 7 or 8 dB per S-unit. Unless you know different, it's okay to figure 6 dB of RF change between S-units 0-9.

The last 1/3 of the scale is calibrated in decibels (dB) over S9 and is, of course, a logarithmic scale, typically in three 10 dB sections though some meters go to 60 dB over S9.

Digital S-Meters, including LED bargraphs may or may not follow any standard scale of calibration. Typically, LED bargraph displays are good only for relative indications or comparisons of one signal to another; "before and after" situations, etc.

Up to this point, you may think that S-Meters are useful only for measuring the relative strength of incoming signals, but think about it for a minute. What determines the strength of signals going into your receiver? More specifically, what factors are under YOUR control that determine received signal levels? I can think of at least four things right off: antenna type; antenna height; coaxial cable quality and length; and the correctness or precision of the receiver's electronic alignment (internal adjustments).

Therefore, there are a number of things you can do around your monitoring post that will affect the strength of received signals. Wouldn't it be nice to know if something you did had a beneficial or harmful effect? Sure! That's one powerful use for an S-Meter.

As an example, say you want to change out your coax cable and want to be sure the new stuff is better than the old. So first tune to a known consistent signal such as a NOAA weather station or perhaps an 800 MHz control data signal. Write down the S-meter reading. Then change out the coax (or elevate the antenna, etc). Then write down the new S-meter reading and compare the two. You'll know if you did right or wrong.

Many scanners are capable of supporting an easy to build and install S-Meter! Most Realistic scanners made by GRE-Japan with the civilian aero band, 108-136 MHz, can support this low cost, high performance S-Meter modification.

It takes special circuitry for a scanner to receive Amplitude Modulated (AM) signals because AM is an uncommon mode in the VHF/UHF spectrum. In fact, AM is used pretty much exclusively for civilian aircraft comms on 108-136 MHz and military aero comms on 225-400 MHz. Most scanner signals are Narrow FM (NFM). Wide FM (WFM) is used in the FM Broadcast band, 88-108 MHz, TV audio signals; and studio-transmitter-links. Everything else is pretty much NFM.

Therefore, most scanners are designed strictly with NFM in mind, and will not have either AM or WFM capability except as a costlier extra feature. That's why you pay more for scanners that have the civilian aero band, and more still for those with the military aero band.

If your Realistic scanner has the AM mode, and it will, if it has the civilian aero band, then chances are good that we can take advantage of its extra circuitry to add the simple, low cost S-metering function.

Scanners known or strongly thought to be capable of this easy S-Meter mod include the following listed in Table 1:

TABLE 1: COMPATIBLE SCANNERS FOR THIS S-METER MOD

PRO-2042 PRO-2027 PRO-39
PRO-2035 PRO-2024 PRO-37
PRO-2032 PRO-2022 PRO-36
PRO-2006 PRO-2021 PRO-34
PRO-2005 PRO-2020 PRO-32
PRO-2004 PRO-62 PRO-64
PRO-2003 PRO-44 PRO-2041
PRO-2002 PRO-43

CAVEAT: Many of Radio Shack's later scanners are made by Uniden, the design of which leaves so much to be desired that this version of the S-Meter is probably not feasible. There may be other alternatives but are beyond the scope of this document.

If your scanner is not listed in Table 1, the best way to determine applicability of this procedure to your scanner is to review the main schematic diagram for your receiver section, and compare it to the circuit of IC-2, Q-12, Q-13, and D-33 of the PRO-2006. This circuit is used in all the above compatible scanners, and is required for this version of my S-Meter mod. Specifically, you will look for the NFM chip and AM detector diode shown in Table 2 further below.

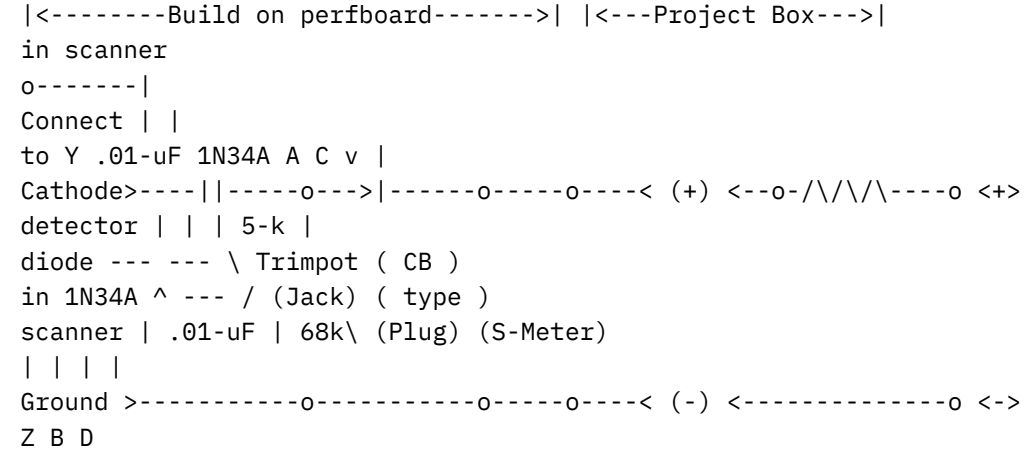
The AM section of the PRO-2006 is almost identical to the AM circuits for the scanners listed in Table 1. Each of these scanners takes its AM signal from the output of the 455 kHz IF filter that's attached to the NFM Discriminator chip. Part of the IF signal goes back into the NFM chip for NFM signals as needed. The other leg of this "Y" is that part of the signal that goes on to a separate AM processor. The key thing here is that both circuits are used full time. Special switch circuits do the controlling of which mode is actually in use, but the circuits are still on full-time. That's why we are able to use the AM circuit to power our S-Meter

The key point here is that you must identify and use the cathode of the AM Detector Diode as the pick off point for your S-Meter signal. If your scanner is capable of this mod, it will have an AM circuit almost identical to that of the PRO-2006. Find it, and then locate the AM detector diode. The diode's banded end is the cathode where the S-Meter signal will be tapped. NOTE: The PRO-2041 and PRO-64 are exceptions that don't use a diode as an AM detector. These use IC-302 and some experimentation is in order to determine the applicability of this S-Meter modification.

For base scanners, build the simple circuit in Fig-1 on a bit of perfboard. For handheld scanners where space is at a premium, it may be best to not use a board, and just build the circuit of Fig-1 directly into the scanner, part by part. Start by soldering C1 to the cathode of the AM detector diode, and the anode of D1 to a handy ground. Then build the rest of the circuit around those two components. Following is Fig-1, the schematic of the S-Meter circuit.

Build the following simple circuit left of Points A and B on a piece of perfboard. The circuit to the right of A and B is optional, explained further below.

FIGURE 1: SCHEMATIC DIAGRAMS



|<--------keep leads short-------->| |<--Any length ok-->|

THE PARTS: Radio Shack stocks the parts shown in Fig-1 except for the S-Meter. Diodes must be germanium, 1N34A or 1N60. Capacitors should be ceramic disks. Resistor (56k-100k) and trim-pot (3k-10k) are not critical. The circuit of Fig-1 must be as shown. If you use an external CB-type S-meter, so much the better....just build the meter of choice into an attractive or functional project box with a cable of any length from the box to Points C and D which should be wired to a male phono plug of some sort.

Most any analog CB-type S-Meter is ideal for this project, but the larger the face, the more readable it will be. There are thousands of junked CB rigs all over the planet, and most any CB or radio shop will have a bin full of them. The cost of a salvaged S-Meter should be negligible.

The scanner should have a mating female jack connected to Points A & B, installed in an out-of-the-way place for the plug from the external meter.

Keep the Point Y lead length very short, not more than an inch.

Connect Point Z to scanner PCB or chassis ground and keep that lead short, not more than 1 inch.

Connect Point Y of the S-Meter circuit via a very short wire to the cathode of:

TABLE 2: CONNECTION POINTS IN VARIOUS SCANNERS

SCANNER	AM -at or near- DETECTOR	NFM CHIP
PRO-2042:	D-34	TK-10420
PRO-2041	IC-302	Try Pin 11 or 5 *
PRO-2035:	D-34	TK-10420
PRO-2032:	D-23	TK-10420
PRO-2006:	D-33	TK-10420
PRO-2005:	D-33	TK-10420
PRO-2004:	D-31	TK-10420
PRO-2003:	D-122	MC-3357P
PRO-2002:	D-119	MC-3357P
PRO-2027:	D-24	MC-3361N
PRO-2024:	D-24	MC-3361N
PRO-2022:	D-29	MC-3361N
PRO-2021:	D-24	TK-10420
PRO-2020:	D-120	MC-3357P
PRO-64:	IC-302	Try Pin 11 or 5 *
PRO-62:	D-302	MC-3361N
PRO-44:	D-202	MC-3361N
PRO-43:	D-302	TK-10420 or 10427
PRO-39:	D-202	MC-3361N

PRO-37: D-122 TK-10420
PRO-36: D-114 TK-10420
PRO-34: D-117 TK-10420
PRO-32: D-122 TK-10420

* Not certain - needs more experimenting

Other Scanners: This mod may work with other scanners that have the civilian aero band of 108-136 MHz. If your scanner has 108-136 MHz and is not listed above, then find the last 455 kHz IF section, and locate the AM detector. Connect Point Y to the cathode or IF-side of the AM detector diode.

CAVEAT: Some scanners turn off the AM section when in the NFM or WFM mode and some don't. If yours doesn't, you're "fat". If the AM section is turned off, you'll have to modify the switching circuits to leave the AM section on, but not feeding the audio preamplifier. Examples of scanners that need no AM switch section modification include the PRO-2004, PRO-2005, PRO-2006, PRO-2035, PRO-2042, PRO-43 and there may well be others. A little experimentation will tell for sure. Use your voltmeter while switching modes.....

==========
NOTE: While this mod probably won't work with Uniden scanners nor Radio Shack scanners made by Uniden, a little R&D and experimenting on a Uniden aero-band scanner could prove successful. I don't own any Uniden scanners, but can assist you in your R&D if and only if you and I both have a copy of the service manual for your scanner. Contact me by e-mail if interested.
==========

WRAP-UP DETAILS: Points A and B are the metering points where any DC voltmeter can be used. S-Meter signal range will be about 0-1v. The circuit of C and D is an optional CB type S-Meter, and should be used external to the scanner. Therefore, it is ideal to wire A and B (length not critical) to a phono jack on the rear panel of the scanner for easy connection of the external meter. Use 1/8" or RCA phone jacks for base scanners and 3/32" submini phone jacks for handhelds.

METER CALIBRATION: Any DC voltmeter can be used directly at A and B including a bargraph LED display. If an external S-meter circuit is desired, then wire it as shown. Use a walkie talkie or other transmitter to send a strong signal into the scanner, and adjust the trimpot so that the meter reads exactly full scale. All other signals will then read proportionally lower. Too cool for words!

METER LIGHTING: You can embellish your S-Meter with a small pilot lamp behind it to illuminate the face. Many CB meters have such a lamp built into the body of the meter. You may have to tap 12-volts or other power from the scanner for the lamp, or provide external power, like for handhelds.

SUPPORT: I do not supply S-meters. I can provide other parts including printed circuit boards, assembled or as a kit. I will provide technical support of this project on the public network forums and/or by e-mail; never by phone. See the beginning of this article if you need a hard copy version of this article.

MOD BOARD INSTALLATION HINTS: Most modification circuit boards really need no special effort in the mechanical installation. I used to use fancy standoffs, bushings, and machine screws, nuts, and bolts, but no more, considering all my mods!

Now I loop a stiff #18-ga copper wire (RS# 278-1217) through a pair of ground holes in my perfboard or printed circuit; solder it securely to the board; and then solder it to a ground on the main board.

I solder the #18-ga wire to a chassis sidewall, or in some cases, to a ground foil on the main receiver board. This mount is rigid, safe, and easy, not only to install, but also to remove if needed. A "glop" of hot-glue on the bottom of the mod board prevents accidental shorts below it.

Enjoy S-metering at its finest!

==========

03: How about an S-Meter for the PRO-26? (and BC-3000XLT?)

Okay, this one is different from the above scanners, but since an S-Meter is already "built in" for the most part, I'll clue you to what little else you have to do.

A. Locate IC-14, Pin 16.

B. Run a wire from IC-14, Pin-16 to a handy jack mounted on the side or back of the scanner.

C. Run a wire from any scanner/PCB ground to the jack mentioned in Step (B).

D. Solder the wire from IC-14, Pin 16 to the center or hot lug of the jack.

E. Solder the ground wire (Step C) to the shell or outer lug of the jack.

F. Button up the scanner.

G. Build the external S-Meter from Figure 1 (above)
exactly as shown under the "Project Box" (right half
of the diagram).

H. Connect the S-Meter to the jack and calibrate it
according to the instructions for the S-Meters in
Question 02.

NOTE: This S-Meter works for the NFM and AM modes only;
not WFM. A separate circuit altogether is needed
for a WFM S-Meter. I may add it to this FAQ
later, so inquire if you just have to have it.

==========

That's it for now. I will keep this FAQ updated. If you
see things that need to be added to it, by all means, let me
know. If this FAQ fails to address your question(s), then
hit me with 'em again, but be specific. And be detailed
with symptoms and observations if you need tech support on
mods or troubleshooting and diagnosis. Use e-mail if you
can.

> according to the price!

Amen! I see the exact same thing. No news about it on the website, either.
SOME stores might be discontinuing it, but a store near me matches the
story above.

And you can't stop amateur radio from existing and advancing, either.

According to you, I see IRIDIUM all only comes down to fun. There's much more to the Amateur Radio *Service* than fun. But I am glad you see my points.

> interest in ham radio = less units sold = less profit for Ft. Worth.

Incorrect by a long shot, CB Rambo; you don't get it. TechAmerica (www.techam.com, Tandy) sells MANY HTs and a mobile or two. The interest in these radios may have been greater than the interest in the 202.

> When Radio Shack dumps the HTX-202, it doesn't take a genie with a crystal ball
> to figure out that there's something seriously wrong with the hobby.

Are you even a part of the hobby? I would assume no. I know only 4 people in the Twin Cities who even HAVE an HTX-202. And I am one of them.

The end of the hobby does not assume the end of amateur radio. This is a 2 meter-only, amateur band-only HT, and there's a demand for dual-banders with wide receive. Who is to say a dual bander won't be appearing on the shelves at Radio Shacks? Not you, obviously. Remember, TechAmerica is a Tandy/Radio Shack company who sells more HTs.

I didn't say that. As Bud says, have you ever heard of ARES or RACES? I am part of "SkyWarn" which is used in serious weather situations.

> yes. internet ? all over the globe.

No, CB is not used on the internet.

> WHO CARES ? Just speak to someone in space ship and call CQ CQ CQ on
> friday night. We DON'T CARE.

Don't speak for everyone, because I'm sure your alone with only a few people.

Yep! I would bet a great deal of money most of the jammers on the local
repeaters are unlicensed CBers.

Tracking Trunked Radio Systems With
the PRO-2004, PRO-2005, or PRO-2006
==

Revised: November 28, 1998

This article is copyrighted (c) 1998 by Bill Cheek
and all rights are reserved. It may be freely
disseminated, stored, and transferred, and placed
on Web sites, so long as the entire article remains
intact, unedited, and unaltered, and there is no
charge for its availability and access.

==

Yes, TrunkFollowing is now possible with the
legendary PRO-2004/5/6 scanners, and perhaps with
other scanners in due time!

NOTE: TrunkFollowing is also possible with a number
of other radios, including Icom PCR1000, R10, R8500,
R7000, R7100, AOR AR2700, AR3000, AR3000A, AR8000,
certain Kenwoods, Yaesu FRG-9600. TrunkFollowing with
these radios requires a different technique and process
than what I will describe here for the PRO-2004/5/6.

YES! You can now track the trunks without a "real"
TrunkTracker scanner! I call it "TrunkFollowing"
to avoid any conflict with Uniden's use of the
terms, "TrunkTracker", "TrunkTracking", etc, but
the results are the same or better.....I think MUCH
better....

Don't get me wrong here - TrunkTrackers are a great
idea; maybe the greatest idea since cellular mods
and anchovies on pizza. My problem is that Uniden
seems to have a lock on TruckTracker scanners so
far. Even Radio Shack's TrunkTrackers are made by
Uniden. Whatever happened to "competition"?

Anyway, I just don't like Uniden scanners. They
remind me of Muntz TV's back in the early 60's.
If you don't know about those, you're better off.

It annoys me to have to buy a glitzy radio with
exhaust pipes, louvre flames, mud flaps, drag slicks

and racing stripes just for a snazzy firmware feature. So I don't do 'real' TrunkTracker radios.

However, it's my pleasure to report on tracking the trunks with the PRO-2004, PRO-2005, and PRO-2006 scanners, and it is probable that a number of other scanners can be included as techniques and processes are developed and refined.

Yes! It is now possible to track the trunks without a TrunkTracker radio. Call it an alternative method if you will, but I think it beats the real TrunkTrackers!

Why is it better?

Well, the PRO-2004/5/6 scanners are easily the best scanners ever brought to market, in terms of what counts up front: performance, features, and modifiability for better performance and more features.

So it makes sense that if these scanners can be made to track the trunks equal to or better than the official TrunkTrackers, then they will be a better value than the TrunkTrackers.

I will hasten to add that this method may not be for everyone. One shortcoming is that you can't track the trunks while you hoof it around via the tennis-shoe express, like with a hand-held PRO-90 or BC-235XLT. But so long as your interests are in automated TrunkFollowing from a base station (or a mobile), then what I've got to show you is unparalleled!

So How Do You Do It?

I said it wasn't for everyone. There may be a modest cost, if you have only the basic hardware. I'll leave it to you to add it all up, but for many hobbyists, it won't break the budget.

Then it takes a little work and a bit of understanding of the process. In other words, I can't hand you a free black box that plugs into the headphone jack of the scanner for happy TrunkFollowing into the here-ever-after. Of course, the 'real' TrunkTrackers aren't free or 'no-brainers' either.....

But I can turn you on to the products and processes that will turn your PRO-2004/5/6 into the slickest TrunkFollower yet.

Following is a list of what you need, together with
an overview of the necessary connections and hookups:

==========
Minimum Requirements For TrunkFollowing With
the PRO-2004, PRO-2005, and PRO-2006
==========

Hardware Requirements

+ HB-232 or CE-232 Interface; available from:
(See signature box at end of this article)

+ PRO-2004, PRO-2005, PRO-2006 scanner with the
HB/CE-232 installed and working.

+ A second 800 MHz scanner of any type that has the
"NFM Discriminator Mod" with the baseband audio
signal tapped out to a jack on the scanner.

+ The "HamCom DataSlicer" or my "Decoder Interface"
circuit that plugs into the baseband audio jack
on the 2nd scanner mentioned above.

For more information on making a Decoder Interface,
see the World Scanner Report, V8N4 and V8N9 or
see my SCANDATA.FAQ, available at my FTP site.

AND, either

+ One modern high-speed PC, Pentium 133/up, (slower
Pentiums might work, but we don't know for sure
yet) running under Windows 95/98 with 3 open
COMports and a different IRQ assigned to each
port. This can be COM1/IRQ4, COM2/IRQ3, and
COM3/IRQ5, for example. You will need to wire a
serial plug to fit COM3 on the PC; a female DB9
or DB25. Just 2 wires come off this plug (ground
& RxD) and go to the ground and TxD pins in the
Data Decoder /Slicer Interface.

OR

+ Two PC's, one a 486DX2/66 or better, running
under Windows 95/98/NT4A with two free COMports
and two free IRQs, say COM1/IRQ4 and COM2/IRQ3,
AND: a 2nd PC, 386 or better, running MS-DOS
6.0/up or Win95/98, with two free COMports, AND
a null-modem cable (or straight-thru serial
cable and a null-modem adapter) to connect
between one of the COMports on each PC.

Software Requirements
==========

+ Pro-Turbo v3.45.33/up, for the HB/CE-232,
available from: Paul E. Turton;
RR # 3; Wainfleet, Ontario Canada L0S 1V0

E-mail: pturton@iaw.on.ca
Web: http://www.iaw.on.ca/~jabba/pro-turbo.htm

+ TRUNKER v3.7(beta) or later (freeware!) available
for download from either of these two web sites:

http://web2.airmail.net/lblant1/dfw/digital.htm

www.geocities.com/CapeCanaveral/Lab/1060/beta.htm

AND / OR

+ ETRUNK v3.7(beta) or later (freeware!) available
for download from either of these two web sites:

http://web2.airmail.net/lblant1/dfw/digital.htm

www.geocities.com/CapeCanaveral/Lab/1060/beta.htm

Typical Configurations for great TrunkFollowing
==========

Using one computer under Win95/98
==========

+ HB/CE-232 Interface connected to COM1

+ PRO-2004/5/6 connected to HB/CE-232

+ Data Decoder/Slicer plugged into COM2

+ 2nd scanner tuned to a trunk data signal, feeding
the Data Slicer/Decoder.

+ Ground & TxD pins of Data Slicer/Decoder patched
out to the RxD and Gnd pins of a DB9/DB25 plug
in COM3

+ Pro-Turbo running the HB/CE-232 in a window

+ TRUNKER.EXE or ETRUNK.EXE running in a second window.

Using two computers
==========

+ HB/CE-232 Interface to COM1 on PC1

+ PRO-2004/5/6 connected to HB/CE-232

+ Data Decoder/Slicer Interface to COM1 on PC2 Data
Slicer/Decoder.

+ Null-modem cable (or serial cable and a
null-modem adapter) connected to COM2 on PC1 and

to COM2 on PC2

NOTE: Optionally connect a straight-thru serial cable to COM2 on one PC over to a null-modem adapter on COM2 of the other PC. This is the same thing as a "null modem cable". Radio Shack's #26-264 or #26-1496 are null-modem adapters.

NOTE: Pre-made RS cables are costly! Make a low-cost serial or null-modem cable with a female DB9 (or DB25 as needed) plug on each end of a shielded 9-wire cable. Electronic stores carry the cable; Radio Shack has the plugs and adapters.

+ PRO-TURBO running the HB/CE-232 under Win95/98 on PC1

+ TRUNKER or ETRUNK running under Win95/98 or MS-DOS on PC2.

Operation
=========

TrunkFollowing operations are managed by Pro-Turbo and controlled by the freeware programs, TRUNKER.EXE or ETRUNK.EXE. Therefore, you should refer to the documentation for Pro-Turbo and TRUNKER or ETRUNK to polish off the rough edges left by this introductory document. But, here's a wrap up and overview of what it takes to run a TrunkFollowing operation.

REVIEW AND SUMMARY
==================

TrunkFollowing with the PRO-2004/5/6, the CE-232, and Pro-Turbo represents a milestone in the transfer of high technology to the casual hobbyist. I haven't had as much pure satisfaction from a hacking and mod'ing effort since about 1988 when I boosted my PRO-2004 from 400-channels to 6400.

What a thrill that one was, and this one is every bit the equal or better. But like I said in the opening lines, it's not for everyone. I can't decide for you, though, so following summarizes what you need to track the trunks with your PRO-2004/5/6 and maybe later, other scanners:

PREPARATION
===========

1. Prepare an APF file for the HB/CE-232 that has
just the trunk freqs of a single system. It must
have channel numbers. Here is an example for the
San Diego city's trunk:

```
, 41,856.0250,nfm,d,,, , 50,859.0250,nfm,d,,
, 42,856.0500,nfm,d,,, , 51,859.0500,nfm,d,,
, 43,857.0000,nfm,d,,, , 52,860.0000,nfm,d,,
, 44,857.0250,nfm,d,,, , 53,860.0250,nfm,d,,
, 45,857.0500,nfm,d,,, , 54,860.0500,nfm,d,,
, 46,858.0000,nfm,d,,, , 55,862.0500,nfm,d,,
, 47,858.0250,nfm,d,,, , 56,862.1000,nfm,d,,
, 48,858.0500,nfm,d,,, , 57,863.0500,nfm,d,,
, 49,859.0000,nfm,d,,, , 58,864.0500,nfm,d,,
, 50,859.0250,nfm,d,,, , 59,866.5625,nfm,d,,
```

As you can see, the channels start at 41 and end
at 59. Channels 60-80 are zeroed and locked out.
Delay isn't important.

2. Program other banks of the PRO-2004/5/6 with any
frequencies you like.

3. Program just the data channels of the trunked
system into a bank of the 2nd scanner, and fill
the rest of the channels of that bank with
locked-out zeroes. SCAN this bank and the
scanner will stop on an active data channel.

4. Prepare a DOS batch file to run the Trunker (or
ETrunk) program. The docs are clear about it,
but here's mine:

```
set TRACKSLICERPORT=COM2
set TRACKSLICERPIN=CTS
set TRACKSLICERMODE=INVERT
rem set TRACKSLICERMODE=NORMAL
set TRACKSCANPORT=COM2
set TRACKSCAN=AR8000
set TRACKSCANPARK=800.0000
trunker.exe
```

Create this batch file with a text editor such
as NOTEPAD or WORDPAD and save it with a filename
like: TRUNKTR.BAT in the Pro-Turbo directory.
Create a shortcut to this batch file and place
it on your DeskTop for quick and easy access.

NOTES: Pro-Turbo acts like an AR-8000 scanner
as far as Trunker is concerned. That's the
TRACKSCAN setting. Note the 'remark' line for
TRACKSLICERMODE=NORMAL. Most trunked data
control signals need to be INVERTed for Trunker
to decode them, but some may need the NORMAL

setting. The above makes it easy to 'rem' out
one and 'unrem' the other, quick and dirty.

5. Read and become familiar with the docs on
Trunker, ETrunk, and Pro-Turbo.

OPERATION
=========

1. Load Pro-Turbo and ensure that it comes up okay
and operates normally. Run the APF function to
load in the trunked system prepared above.
AutoProgram any other channels you want at this
time.

2. Load Trunker or ETrunk and ensure that it comes
up and operates normally. Make sure your Data
Decoder/Slicer works fine with Trunker before
trying to TrunkFollow. The two will run
separately, if you want.

3. Run the TrunkTrack feature of Pro-Turbo and
follow its instructions for testing the setup,
and then run it!

4. Read the Trunker docs for the in's & out's of
running a TrunkFollowing operation.

That's it: Hands-off TrunkFollowing! Most operation
is from the Trunker window and it's mostly hands-off
with Pro-Turbo and the CE-232. And, it's all easier
done than talked about.

Most of the above connections and preparations are
a one-time effort, leaving you to enjoy the automation
of tracking the trunks. Oh, and you have a lot more
control over and understanding of the entire process
of trunk-tracking than you do with a "real"
TrunkTracker scanner - a lot more!

I'll be the first to say that tracking the trunks
with Pro-Turbo, a CE-232, and a PRO-2004/5/6
scanner is anything but "state of the art" yet.
After all, this is the first public announcement of
the dynamic trio, but I think it is ready for prime
time, and that the first wave of users will help us
refine the instructions and efforts that it
initially takes to get up and tracking. By golly,
it works!

The Fine Print
==============

I had some trouble initially getting my Trunk-Following operation up and running. Most of the trouble was my overloaded computer and a lack of free IRQs and COMports. I solved the problem by moving the sound card IRQ from 5 to 10 and by swapping video cards with one that didn't use an IRQ.

I doubt many of you guys will run into the kinds of problems as I did. I'm weird, and pack everything possible into my PC's. I could have easily set up TrunkFollowing on any of my other PC's, but I wanted it on my main workstation so I could run the darned thing and write about it at the same time. You won't run into this type of issue, most likely.

Your problems are more likely to be with the system as a whole and with the Trunker and ETrunk programs. System-wise, I can tell you to avoid slick tricks and underpowered machines. Trunker and ETrunk work fine on MS-DOS machines, but they are very demanding of CPU resources, and so don't count on blazing performance when you run them under Win95/98, especially on the slower Pentiums.

Trunker and ETrunk will run fine alone in a DOS window of Win95/98 on a 486DX2/66, but you really can't expect to run much more at the same time on that old and slow of a machine. Pro-Turbo runs fine on a 486DX2/66, too. But combine it with Trunker or ETrunk at the same time to track the trunks, there may be problems with machines less than the Pentium 133. That's why we came up with the two-PC method.

Pro-Turbo on a 486 and Trunker or ETrunk on a PC-386 DOS machine were demonstrated to work okay. This should give you a guide....

Most problems in the beginning will be with Trunker or ETrunk but if you can test each separately first, then any TrunkFollowing problems will be easier to resolve.

Most issues with Trunker or ETrunk will be a learning curve. These two programs are freeware by an anonymous author who is concerned that Motorola and the federales might lop off his head and holler down his neck. As you might suppose, tech support for these programs isn't great. Support comes mostly from the public media where you post a question and someone offers an answer.

The docs for Trunker or ETrunk are okay, but not great. It will take a little plunking around to get

a feel for how these hummers operate. Once you get
that "feel", then you'll be tracking the trunks
with the best.

I'm understating when I talk about TrunkFollowing at
its finest. It works pretty slick and wicked!

Again, the person in Michigan, that is the person the thread has
evolved about, who was making TK software, was NOT
prosecuted in a criminal action.

The case made against him was civil.

Hi, I have an Optoelectronics Scout Frequency Finder/Recorder,
retail. A stubby antenna for the Scout and 4 ($60.00 each)Startek
filters for the Scout, a Realistic Pro
2026 mobile/base scanner(unblocked), and a magnetic
mount antenna, that I would like to trade for a Spectrum XLT metal
detector of any age.(in
any condition as long as it is working)or a Garrett GTI1500 metal
detector. You can see
the Scout at www.optoelectronics.com Jeff Voyles 618-566-8968 or
e-mail.

I'm not anti-HAM, but I never wrote that
IRIDIUM all only comes down to fun.
IRIDIUM defeats HAM radio for world-wide
handheld digital satellite communication.

But, as you write, I am not blind to the assets
of HAM, it's just that as IRIDIUM evolves to
what it is supposed to: handheld digital satellite communication for the
masses, HAM becomes more and more of a hobby, not an option.

Any air scanner fans out there ?
Did you know that after you hear your flight
on the scanner, you can enter the flight
number on the Web and actually see your
flight in progress, graphically, over the
continental United States, its position,
heading, air speed, and altitude at:

http://www.thetrip.com/usertools/flighttracking/
graphical/find/form/0,1346,1-1,00.html

Ever hear that flight number reporting to a FAA Flight Center
but you never knew where it was heading or where it came
from? Now you can see it at the above URL.

>
Hmmm. Although there are a few hamsats that you can use with just the
duck on the hanheld, most cannot, and require an antenna that you
cannot reasonably handhold.

>> 3) Caller ID, Caller Waiting
>
>So? I don't need to know who's calling. However, some reverse autopatches I've
>read about do tell you who's calling, and can let you know if you've got another.

'The point is, that it is a dual use phone. Two methods of
communication. All the sats go down, there is still use in many
areas of the world.

>> Now, let's take a look at the better features of HAM radio:
>> 1) cheaper
>
>I can add much to that:
>2) much more widely used
For now.

>3) can take or receive telephone calls (called reverse autopatch)
So can Iridium.

>4) can send and receive email with just a laptop, radio, TNC, and antenna.
Chuckle. And I will take a nap while waiting on the speed. Iridium
SMOKES Ham in this one.

>5) more fun (more functions than just calling people)

Now, this is subjective. It depends on the user. What do they
want?

> a. Around the globe with 5 watts and a not-so-big antenna

Iridium does it with less power.

> b. Can communicate with anyone - even if they speak no word of English
So can my Email, with a translation program, on an Iridium phone.

> c. Can easily communicate with satellites with surprisingly very small
>antennae.
But can't make a phone call over those sats.

>6) Won't go dead when satellites and cellular/PCS towers and systems do.
>
Think again. If you are useing sats, HAMSAT will go down when those
sats go down.

If you are using an autopatch, the patch will go down when the
telephone system goes down.

All in all, the Cellular towers seem quite a bit more reliable than
many HAM repeaters.

>> Looks like 5 -1, IRIDIUM wins.
>
>It might look like that, though you probably need your vision corrected.
>
And you young man, need to get your facts better in order.

>> And, try setting up your ham antenna on a
>> rubber raft in the middle of the Pacific Ocean, while I nonchalantly take out
>> my IRIDIUM from my shirt pocket and make a call to the other side of the world
>> while I'm watching you set up. Now, THAT is the joke.
>
>No joke. There are antennas that are as simple (and the same) as the very antenna
>that pops out of your phone: Helical antennas. Just this single "ham antenna" can
>easily transmit and receive to/from satellites.

>
And hope someone is listening, or there won't be so much QRM that you
cannot get through. Meanwhile that person with the Iridium phone
dials into the Coast Guard, gets them enroute, calls his wife, tells
her that he will be a bit late, and drop the seafood dinner, he would
rather have steak.

>How is a small phone fun? Do you learn anything about electronics? No. Can you
>talk to someone who doesn't speak English? Not unless you speak their language.
>

Now here is the big thing. Iridium, and HAM, are two different
things.

Think about that.

If you need reliable telephone, email, data access, and paging,
anywhere in the world, use Iridium.

If you need a hobby, that can expand your horizions, teach you new
things, allow you to assist in times of need, get a ham ticket.

Sure, there is some overlap, but just like the overlap between
my horse and my car, neither replaces either!

And again I suggest Ryan, get your technical facts
straight.

Have a nice day.

The problem with the Ham radio concept is the fact that , correct me if
I am wrong, there is a rule that prohibits you from talking to people in
certain countries.
The Sony ICF-2010 is a cool radio

Well, you are CORRECTED. It is NOT illegal to talk to certain countries.

Ah, I once read that each radio has its own unique radio frequency (or
something like that.) fingerprint. There once was a program advertised
in one of the Communications magazines (forget which one.) that
actually let you see the fringerprint. That way if you think that
someone is jamming then maybe you could find that person (Politically
correct phrase instead of saying him or her. See what C.B. operators
are capable of????)
Did you ever try triangulation???? This is also supposed to be able to
pin point where the jammer is located @.

Gotta Pick at this a little...

>> 3) can take or receive telephone calls (called reverse autopatch)
Remember you said that you just read about this? How many repeaters used this.

>> 4) can send and receive email with just a laptop, radio, TNC, and antenna.
At what speeds?
>> b. Can communicate with anyone - even if they speak no word of English

I never understood this. How does one talk to another person (via morse code I persume) if they don't know English?

I do like ham radio (just haven't gotten my ticket yet) don't get me wrong but some of this just didn't sit right.

Greetings,

I would like to inform all Scanner Listeners, Amateur
Radio Operators, & Communication Hobbiests of three
mailing lists that caters to these topics!

* scanner
* antenna
* ham

Our Mailing lists have been active for over 1 1/2 years.
Participants share a common interest in communications.

If you are interested in joining any of our three mailing
lists, simply visit the following website for further
details.

http://www.honk.org/ham/lists/

I would also like to stress that these lists are closed,
therefore only people on the lists can post to the lists.
All email address information is classified, and is not
available to the general public.

I use an authorization code system, so only you can
be added to the list of your choice. This filters out
unwarrented subscriptions, for your convenience.

You will be validated right away, and added to the mailing
list of your choice.

If you have any questions, please feel free to contact me.

Have Fun, and I hope to hear from you!

73's

James Poulin

> monitoring them or is the scanner becoming obsolete?

I'm guessing they are talking about them converting to trunked, digital and digital trunked systems. For the most part, I doubt their reason for changing is to keep people from listening to them, but it may be the case for some places. Like it or not to people with scanners, these systems add features not available. They allow more channels to be added without applying for a new license from the FCC each time. Also, digital systems clear up the audio to near perfect sound. If you are in a hazy area but still within range, it will not have much static (maybe a few dropped syllables).

Mitchell:

They're probably going digital. Here in Michigan, our State Police did exactly that... took all the fun out of it!

As far as I know, there is currently no way for the hobbyist to monitor digital radio... or if there is, they're afraid to talk about it!

Source record: 136768

Governments in the U.S. are using it for privacy.

Nextel's listings are not well organized in the FCC database.
The listings do not map to actual usage.
I am sure there is more than this, out of my range, as they just about taken the whole spectrum from 851-866 MHz.

It uses VSELP (Vector Sum Excited Linear Predictors) vocoding, QAM (Quad Amplitude Modulation) modulation, and TDMA (Time Division Multiple Access) 6 channels splitting.

Nextel's all DIGITAL voice/data SMRS frequencies at the Winter Garden, Florida site:
MHz output (minus 45 MHz input)
858.3625
859.1375
861.9125
862.5375 .8125
863.0875 .2625
864.4125

Other central Florida area Nextel all DIGITAL voice/data frequencies:
851.0625 .2375 .8625
852.0625 .1875 .2125 .2625 .5125 .5875 .6125 .6625 .8875 .9125 .9375 .9875
853.1875 .2375 .2875 .3125 .3625 .5625 .5875 .6125 .6875 .7875 .8125

In Edmonton, Alberta, Canada they switched over to a erickson digital
trunk system about a year
ago and so the only thing you can here is the police cell phone calls that
are still analog. You can't
here fire or ambulance either and with most new cell phones being digital,
I give the scanner hobbyists about 5 more years and all the good stuff
will be gone.

Ben,

Your options are as follows:

a) Free SW: Other Soundcard type programs are BTL and WDECODE. BTL is quite good for RTTY but there isn't too much RTTY out there. WDECODE also does RTTY as well as SITOR-A and B. I like its spectrum analyzer because it helps determine the shift of the signal. It works reasonably well with RTTY but in my experience its SITOR-A/B decoding capability is not too good.

b) Moderate investment: If you are willing to spend say $50-70, what you need is a simple interface and appropriate SW. The interface can be built for less than $10 with parts from Radio Shack. You can buy the same kind and some better ones for anywhere from $30 - $70. Appropriate SW includes RadioRaft or Hamcomm. There may be others out there. I have RadioRaft and it takes a little bit of experience to get it to decode different modes. I'm still learning.

Hope this helps. I too am a beginner and after spending more time in the last few weeks than my wife would like I'm starting to get the hang of it. If you need more help, feel free to drop me an email and I'll do what I can.

c) Expensive: Depends on what you would consider expensive but I would put the Hoka line of products, the Kam line, the Universal line of Mxxxx. These apparently have all the bells and whistles.

>Why target CB? Why not HAM radio. Those people have more antennas on
>their houses and cars then the cops.

With due respect to the legit Citizen Band Operators, and excluding
those operators, I think that it is fair to say that most HAMS know
how to minimize interference and are inclined to do so.

Most CB'ers don't have a clue how to minimize interference nor or most
of them inclined to care.

At 5 watts of RF, there usually is not a problem with RFI. This was
not an issue 30 years ago since the CB'ers of that era conformed to
the regulations regarding RF power output limits. Having spent alot of
time listening on 27 Mhz, it has been my observation that most CB'ers
these days are using amplifiers and they are overmodulated on AM and
driving their audio too hard on SSB as well. These two things alone
contribute massively to RFI problems and I believe comes from a lack
of understanding of basic radio communications theory.

HAMS are educated in these principles and for the most part, have
clean emissions. I am not defending the content of these emissions,
just the physical characteristics of them.

my 2 cents........

Paul

Dave, you've got it all wrong. Read the law you quoted, dude. You
CAN read, can't you?

HR 695 (SAFE) is a bill that protects Americans' rights to use whatever
type of crypto they want, and prohibits requiring crypto manufacturers
to escrow keys for "big brother."

Here's what the latest version of HR695 REALLY says:

`Subject to section 2805, it shall be LAWFUL [emphasis added...i.e. NOT illegal]
for any person within any State, and for any United States person in a foreign
country, to use any encryption, regardless of the encryption algorithm selected,
encryption key length chosen, or implementation technique or medium used.

`Subject to section 2805, it shall be LAWFUL [emphasis added] for any person
within any State to sell in interstate commerce any encryption, regardless of
the encryption algorithm selected, encryption key length chosen, or
implementation technique or medium used.

(a) PROHIBITION- No person in lawful possession of a key to encrypted
information may be required by Federal or State law to relinquish to another
person control of that key.

(b) EXCEPTION FOR ACCESS FOR LAW ENFORCEMENT PURPOSES-
Subsection (a) shall not affect the authority of any investigative or law
enforcement officer, acting under any law in effect on the effective date
of this chapter, to gain access to encrypted information.

(note no requirement for crypto software producers to maintain back door
keys...if they DID keep such a key, the government COULD require it be
given to them with a court order...but if a back door doesn't exist, it can't
be given up)

(section 2805 says it's illegal to use encryption to further commission of a
crime)

I have been doing this scanning thing for some time now, so I was very surprised when I learned this last night:

When I removed the antenna (stock Uniden duck or Watson-801) from my SC-150 and new BC-235XLT scanners, I found that the local 850-870Mhz public service radios came in MUCH better than with the antenna!

I tried numerous other antennas (general wideband type scanner antennas), and the radios still had better reception without them!

I doubt this works across all freqs, but I found it quite interesting!

Yeah I heard it was two seconds when turned off but for some reason I heard some people saying these two seconds were no good when scanning a trunked system, although I don't understand why only 2 seconds would be a problem. Does this 2 second delay really pose a problem?

As a law enforcement Sheriff's Deputy Cadet K-9. I have used this radio for only emergency activies(once or twice). Now that our department is given us new radios they decided to give us these ones.This radio is BRAND new. This radio comes with a recharger,cord, antenna, 2 programmable channels,recharger craddle, brand new motorola batteries.
If interested please send me an email or call me 541 472 0065 if you're intersted.
Thank you for interest

Deputy John Graham
Josephine County Sheriff's Office Cadet K-9

What???? Hams are educated???? So, CBers are not educated, hmmm? Well
then how would I know about Ham Radio, Cb Radio, Inmarsat, Globstar, &
Iridium??? Why then do Hams need their own little radio police
force????

I have several Minitor I's for sale in good condition. These are in the
hard to find red case (some have ID's numbers written on the side of the
case. These worked when taken out of service but they have no reeds or
batteries. Units are on 155.775 or 154.385. I will also include a
non-amplified drop-in charger. I have no way to test these so they are>
sold as
is. Price is $20 plus $5 for shipping. Buyer to prepay by money order. Thanks!

> Remember, When the chips are down, the buffalo is empty

Most laptops use Motorola's VRM system, which uses "RD-Lap" protocol. So
far no program is publicly available to decode this. Older terminals
likely used a protocol known as "4800" which was easily decoded by freely
available software running around the Net.

I have yet to see an encrypted MDT system on a 4800 protocol. I do not
believe the RD-Lap protocol to be encrypted, if not it may become
watchable if someone can write the code to do it.

There are other formats out there, your mileage may vary...

Back in the 50s, the US was so right wing that talking over the radio to any country with communist or socialist governments could get you in serious trouble. Even listening to "Radio Moscow" would raise eyebrows. The list of "banned" countries stems from that era. I have held a security clearance for about 30 years and the rules governing conversation and travel to socialist, or former socialist countries have eased up tremendously.

Try www.policescanner.com
You can listen to the Dallas-Ft. Worth comms there via realaudio or the
windows media player if you don't have realaudio. Also New York City, L.A.,
and a couple of other police depts. as well. Neat stuff!

No big suprise. The 800mhz up region is best received with a very short antenna, or in your case "No" antenna as the wiring going to the mount is probably sufficient.

According to my info, here are the places using repeaters:

Valley Division
Chico Dispatch
Chico, Oroville, Willows Brown
Williams, Yuba-Sutter Brown
Sac Comm Center
South Sacramento (Carpenter Peak) Black

Fresno CHP Gang Task Force FGTF
Border Division
Border Comm Center
San Diego Orange 1
El Cajon Gold 1
Oceanside, Temecula Tan 1
COMMON Blue 1
Coastal Division
SLO Dispatch Center
SLO, Templeton, Santa Maria, Buelton White
Monterey Dispatch Center
Monterey, King City Black
Santa Cruz, Gilroy Green
Inland Division
Inland Comm Center
San Bernardino Copper 1

Barstow Dispatch Center
Barstow, Victorville, Mojave White
Morongo Basin, Needles White
Bishop Dispatch Center
Future Turq. 1
Future Beige 1

Channel Input Output

Brown 42.820 42.500
Black 42.700 42.460
FGTF 42.780 45.020
Orange 1 42.660 39.400
Gold 1 42.200 39.600
Tan 1 42.840 39.800
Blue 1 42.180 39.140
White 42.720 42.560
Green 42.240 42.540
Copper 1 42.740 39.260
Turquoise 1 42.020 39.680
Beige 1 42.080 39.880

I know that at least Green in Santa Cruz/Gilroy isn't always on the repeater, I have no knowledge if the others use the repeater all the time or not. If anyone knows of anything different from this or if any of this info is wrong, let me know. This info was as of August. I was told by my source that Santa Cruz uses the repeater during weekends, but usually duplex the rest of the time.

Most hams carry their license on their person anyway. You are required
to if you are operating mobile.

It looks like it probably is METROCALL USA Inc. WNJG997, transmitted from
Cal State Hayward, licensed for 350 Watts. But it could also be PRO NET
Inc. WPLX447, transmitting from San Leandro, also licensed for 350 Watts.
Both look like they are paging networks.

I got to typing to fast and got ahead of where I was. But if you couldn't figure out what I meant then who cares. Not me. And to attack me on my spelling ansentence structure just shows that you couldn't attack the point I made. I have my ham ticket and see the repeater jammers plus all the old timer Extras that will jump in making coments and not ID themself as they are supose to. But then maybe you do that too.

Bob;
Its a requirement in The U.S. also;

Permissible countries: Section 97.111 of the Commission's Rules, 47
C.F.R. ï¿½97.111, authorizes an
amateur station licensed by the FCC to exchange messages with amateur
stations located in other
countries, except with those in any country whose administration has
given notice that it objects to
such radiocommunications. Currently, there are no banned countries.

Not anymore. All you have to have is the fact that it's listed on the FCC's web page. You don't even have to wait for the "Hardcopy" to be delivered before operating. Yes in the old days but not today.

Here is a mishmashed list of the 39MHz freqs from several sources.

Base Mobile
---- ------
39.14 42.18 Blue 1, Tac 8 (patched to 42.34)
39.2
39.22
39.26 Copper 1 (San Bernardino)
39.34 42.26 Peach 1 (Central Los Angeles), Orange 1, Tac 3
39.36 42.24 Green 1, Gold 1, Tac 2
39.4 42.66 Orange 1 (San Diego)
39.42
39.44 42.16 Purple 1
39.46 45.86 CLEMARS
39.48 Copper 1
39.6 42.2 Gold 1 (El Cajon)
39.62
39.68 42.02 Turquoise 1 (Riverside), Green 2
39.72 42.6 Gray 1, Mauve 1
39.8 42.84 Tan 1 (Oceanside / Temecula)
39.88 Beige 1 (Rancho Cucamonga)
39.92 Purple 2, Red 1, Tac 4, Border Tac

You will have to verify these yourself. Please post your findings.

>happening and asked him if he could go somewhere else and he
>obliged. End of problem.

No, the "problem" just moved somewhere else, and in your
case the "problem" wasn't solved one bit, because the next
pickup truck could very well have a licensed radio amateur
running 1500 watts on 10 meters, a "legal" operation, and you
will have the same audio rectification problem.

BTW - FCC tests in the 1980s showed that as little as 4 watts,
the CB "legal" power, can and will cause audio rectification
and TV interference if the stereo or TV does not have adequate
rejection capabilities. Presence of interference is NOT an
indicator of unlawful operation.

>Our PD recently installed laptops in all vehicles to serve as Mobile Data
>Terminals. Is is possible to capture the data and display it?

Very improbable....since the link is probably encrypted. The PD's
using laptop solutions and radio modems are typically using the
"Cerulean packet data" solution. The rf platform is CDPD, and the
link is run thru crypto.

This is completely different from the static solution in a fixed
PDN (private data network), ie. the Moto 9100-T's, "dolphin", etc
or even the "Forte" mobile data products. They are not encrypted
and hence vulnerable to interception (and subsequent decoding).
However, future versions and "upgrades", will embody secure messaging.
So the sound card trick won't work anymore.....Have fun while you
can....

i realize they are different from LiOn's ....but
everready (energizer) dose make litium AA. i have used them with good
results, although i did not use them in my scanners. they are kinda
expensive. $6-$7 for 2 at the shack. and when i saw them at k-mart
they were aprox. the same price

i have a question on how this works
the FDNY has a MDT in every truck, while rolling they get a MDT
message, with info about the fire they are about to fight. (building
size and type, exposures, etc) my question is : dose every truck/mdt
have it own freq. how do they keep a message intented for one truck
from going to another. also the FDNY uses the MDT in conjunction with
thier radio's. for example a truck could be called on the radio to
notify when they are clear, and they can respond via MDT

TPH <tphugh@mediaone.net> wrote about the new PRO-2066 mobile:

> Any first-hand experiences, pros/cons appreciated.

I recommend the PRO-2066 for mobile use.
I tested a PRO-2066 and sent the review
to Monitoring Times for publication next year.

Like other scanners I've tested mobile, the PRO-2066 heard
cellular phone interference when I parked in a "cell torture area",
1/4 mile in plain view of a combined cell phone and PCS
transmitter site.

Once I left the cell/PCS site, reception while in my pickup
truck was cleaner than my other mobiles, e.g., the BC760XLT
and RELM MS200. Triple conversion using a high IF means
it doesn't have the image problems of the other mobiles.

Laboratory measurements were on the mark, too. Quantitative
test results appear in my review, including SINAD sensitivity
graphs, audio power and distortion, birdies, etc.

If you intend to use the PRO-2066 as a base radio, make sure
you use a well filtered power supply lest
you experience AC hum, as I did. You'll need to install
rubber feet and an external speaker for best use at home.

Happy monitoring!

I am sure many of you have used or heard of this but I thought as a reminder for those that haven't I would mention it. If you take a large alligator clip and connect a random hunk of wire (say 4 feet) to it, then place the clip at the base (ground) portion of a metal whip type antenna such as the Radio Shack or others (this of course doesn't apply much to a plastic rubber duckie type antenna) and just let the wire hang, you should typically notice anywhere from 25 to 50% improvement in reception, especially at the lower frequencies such as 40-50mhz. The wire (radial) effectively takes care of any stray static and even by moving the wire around a bit can make differences. Working with it this morning I noticed in some cases that certain frequencies went unnoticed without it, and with the wire were very readable with little static.

If the municipal ordinances being discussed here actually go into effect how does a ham obtain and use that FCC data as a defense when he gets pinched for interference?The worst TVI/RFI generators in town were the local police cars on 39.700 and the aircraft overhead at low altitude on final into Philly. The neighbors couldn't tell the difference between any of 'em and me let alone any difference between me and the couple CBers in the neigborhood with their mistuned 100w amps. I was The Permanent Perp because I had the big tower, period. You cannot convince a neighbor that his nice new $2,500 sound system could possibly be defective and that the interference ain't your fault.

It would work even better if you made it a 5 foot piece of wire. 5' is close
to 1/4 wavelength at 46/49Mhz. Even better yet if you connect a second 5'
piece of wire to the ground side and stretch it out horizontally.

Why target CB? Why not HAM radio. Those people have more antennas on
their houses and cars then the cops.

What the hell are you talking about? Although Cerulean is certainly
a player in the field, there are MANY different players, including the
leader, SCA, Software Corporation of America, and their Premier MDT
system. SCA has a more versatile product, works better, even
Motorola is now reselling it.

>
>This is completely different from the static solution in a fixed

Brrrp. Wrong. Private data networks can, and do, support Cerulean,
SCA, Coded, and any number of different MDT/MCT solutions.

>pinched for interference?

ASS-u-ming that the Feingold Amendment gets through the screen
of heavy flak that I and others intend to put up to keep it
from going through, the "locals" will have authority only in
regard to CB transmissions using unauthorized power and/or
channels. As proposed, the Amendment will have a specific
exemption for anyone licensed in any other service using
equipment in that service (a catch-all courtesey of the ARRL to
exclude ham operators) and an opportunity for "removal"
(transfer of jurisdiction) to the FCC of any arrest/citation
before any local court action can commence. No authority will
be granted to "locals" for any other enforcement action in any
radio service.

The above is not specific leagl advice but if it comes down to
real life remember what I do for a living....

>You cannot convince
>a neighbor that his nice new $2,500 sound system could possibly be
>defective and that the interference ain't your fault.

That's why both the FCC and the private sector legal folks like
myself adopt the "one shot" approach. We tell them that it's a
deficiciency in their own equipment, point them in the
direction of getting help for themselves, and take no further
action unless my client the ham gets harassed and then I get a
restraining order against the harasser.

As far as I know, the change to 39mhz is just for Southern California and not all of Southern California. The list you have is only partially aaccurate. Most of those frequencies are still in use just different areas. The CHP has added numerous frequencies in the last several months.

Hope this helps ...

Mike

There is lots of non-trunked activity. Although I hear that Ohio is
supposed to get a Statewide Trunked system. Some people say that tyhis
will happen some people say that this will not happen. It all depends
on who you talk to.

Any idea where I can get an updated list of CHP frequncies? I've
already checked Police Call and the Bay Area Frequency Directory
and neither of them seem to have a very accurate list for CHP.

Do you know which ones are no longer used?

I have set up a web page to document the problems that users are having with EF Johnson Systems, specifically the Chester County, PA system where I am a resident.

At this point I am soliciting comments, pointers to online information, articles, newspaper clippings.. anything to add to the content of the system. I am willing to pay all copying and postage costs. Any information that anyone can provide would be greatly appreciated.

BOTH GOOD AND BAD Information is solicited. This is NOT an EFJ smear campaign.. I am just trying to get the facts out there.

Your help is appreciated in advance. Email is preferred.

The UK licence permits contact with any LICENCED amateur
anywhere in the world.

The ITU does not have a banned countries list. That list is
the FCC's Banned Countries List and only applies to Americans.

(Most Arab countries are forbidden to contact Israeli amateurs).

How does one who is not a member of the legal or political communities support that effort? The way to most effectively kill something like this is to kill it before it even gets off the ground.

Seems like the ham then would need to carry his ham ticket around and be able to make it as available to the authorities as are driver's licenses and registration cards. Plus a copy of whatever ordinance might apply with the exclusions highlighted. This thing has the potential for driving street cops nuts. How the heck is a street cop ever gonna tell if a CBer is running 4w or 400w??

Ugly and the last resort. I suffered huge doses of abuse and harrasment including severed tower guy wires but never took any legal action because I didn't want to give ham radio an any worse rap than it already had. Stupid.

Jim,

By the way, (BTW), here is the precise excerpt from the U.S. FCC rules and regulations:

Permissible countries: Section 97.111 of the Commission's Rules, 47 C.F.R. §97.111, authorizes an amateur station licensed by the FCC to exchange messages
with amateur stations located in other countries, except with those in any country whose administration has given notice that it objects to such radiocommunications. Currently, there are no banned countries.

MultiMode 1.2.1 has been released. It runs on any PPC MacOS system, and may run on some fast 68040 Macs. A windows version is *not* available.

MultiMode is shareware. The MultiMode web site URL is http://www.blackcatsystems.com/software/multimode.html

MultiMode decodes the following signals:

Morse Code (CW)
RTTY (Baudot)
ASCII
SITOR-A
SITOR-B / FEC / NAVTEX
WEATHER / SATELLITE FAX
ACARS
WWVB Time Decode
DTMF
Audio Spectrum Display to aid in properly tuning in stations

>support that effort? The way to most effectively kill something like this is
>to kill it before it even gets off the ground.

Senator Russell Feingold (D-Wisconsin), the author of this
stuff, was reelected this past month so it is expected that he
will again introduce it into the Senate. If past performance
is a guide, it will be referred to the Senate Commerce
Committee and probably emerge as an amendment ("rider") on
another "must-have" telecomm bill, such as the McCain
Anti-slamming Bill last session.

Gotta' keep the ear to the ground. I'm pretty plugged in to
Rep. Anna Eshoo, my local Congressrep who is on the House
Telecomm Subcommittee, so that's a help. I've sensitized Steve
Mansfield, the ARRL's congressional liaison, to this problem as
well.

>Seems like the ham then would need to carry his ham ticket around and be able

6256. Voice Inversion Descrambling program and which unit for descrambling is better?

Newsgroup: rec.radio.scanner
Date: 1998-11-29 00:00:00 UTC
From: nospam@nospam.com
Message-ID: <3661c40e.2181337@news.earthlink.net>
Source record: 136530

Someone at this website has a little program that does voice inversion unscrambling from your soundcard, it's at http://www.inetone.net/Fsmith/index.html , on his page he also mentions an electronic unit called the "DS-5 Speech Inversion Descrambler Unit" which costs $89.95, it's supposed to do the same thing, the difference being you can take it with you. Does anyone know how these things compare to the Ramsey SS-70 unit for unscrambling voice inversion? Where can one buy the Ramsey, I've heard it costs around $40. Would the program do the same thing as these two units? And what type of cordless phones can these things unscramble?

6257. FS: Pro-43 Unblocked $225 with Case

Newsgroup: rec.radio.scanner
Date: 1998-11-29 00:00:00 UTC
From: longbch@juno.com
Message-ID: <73sldp$u66$1@nnrp1.dejanews.com>
Source record: 136531
Cross-posted to: rec.radio.swap,rec.radio.scanner

I have a Radio Shack Pro-43 handheld scanner for sale.

Here are the details:

- good to very good condition
- the diode has been moved giving it 870-890 MHz and 51-88 MHz coverage
- no other mods done
- original rubber duck antenna
- all packaging and manual
- pro-64 leather case included (fits pro-43)
- everything on the radio works - never had any problems
- FCC ID number AA020-300, serial number 077222

I would like $225 (COD), and we can split the shipping.

If you are interested, please e-mail me at: longbch@juno.com.

Thanks,
Kelly

6258. Is there a need to worry about systems going trunked in NYC?

Newsgroup: rec.radio.scanner
Date: 1998-11-29 00:00:00 UTC
From: nospam@nospam.com
Message-ID: <3662cd8c.4611059@news.earthlink.net>
Source record: 136532

I'm thinking about getting the Yupiteru 7100 scanner, but the bad thing about it is that you can't turn off the delay which I hear can make it impossible to scan trunked systems. Now in NYC where I live almost nothing is trunked, but should I be worried about NYC going trunked? If this were the case then I might think about getting a different scanner.

6264. RED ALERT - Congress is repealing the Bill of Rights

Newsgroup: rec.radio.scanner
Date: 1998-11-29 00:00:00 UTC
From: D Stark <dstark2@rochester.rr.com>
Message-ID: <WL582.18$c7.89454@newse1.twcny.rr.com>
Source record: 136538
Cross-posted to: rec.radio.scanner,alt.radio.broadcasting.open

Congress is considering bills in both houses that will give the Federal government total control over all encryption technology and make creation and distribution of encryption software that does not have a "back door" to immediate access to the plain text a Federal crime.

The standard for prosecution of those suspected of distributing such software, and for seizure of computers, etc. will be "a factual basis establishing the relevance of the plaintext" to an investigation. No more probable cause, due process, etc. The Bill of Rights is being repealed by Congress, with the likely cooperation of the President.

The government will be able to conduct secret hearings to investigate anyone accused, and "public disclosure of the proceedings shall be treated as contempt of court." Welcome back, Star Chamber.

The bill also creates the Encryption Industry and Information Security Board, with seven members from Justice, State, FBI, CIA, White House, and six from the industry. So in any vote, the Government always wins.

To view the official text of the "Security and Freedom through Encryption" (SAFE) Act, go to
http://thomas.loc.gov/cgi-bin/query/z?c105:h.r.695:

In my personal view, a vote in favor of this bill is an act of treason against the Constitution of the United States.

You think you've got problems with trunking and digital radio systems. The government doesn't want you to know ANYTHING any more, or to be able to conceal anything from Big Brother ever again.

>Apples to Apples. The Iridium phone uses a duck, with no requirement
>for an external antenna.

Actually, there are 3 Iridium phones to choose
from (and 2 Iridium pagers).

1) The Iridium Phone by Motorola
Weighs less than half a kilogram.
Compatible with GSM900 and CDMA/AMPS/N-AMPS 800 standards with
additional standards planned in the future,
plus the Iridium satellite network.
This phone has the satellite antenna built into
the top of the phone like a GPS unit. It has
a extendable rubber duck for the cell phone
mode.

2) The Iridium Phone by Kyocera
Compatible with PDC, CDMA 800, GSM 900
or AMPS plus the Iridium satellite network.
This phone detaches from its satellite antenna
cradle for cell phone with an extendable rubber duck. To use satellite, simply
pop it in the satellite antenna cradle.

3) Kyocera Iridium Satellite-Only Phone
Big, long, obvious satellite antenna on this one.

6269. Discriminator MOD problem need some help.

Newsgroup: rec.radio.scanner
Date: 1998-11-29 00:00:00 UTC
From: arctic4@hotmail.com
Message-ID: <3660ed99.35722516@news.total.net>
Source record: 136543

I added the discriminator modification to my FRG-9600
and to my 2004. The problem I have found afterwards
is that: when I connect a mono patch cord to the
scanner 9600, I lose the squelch, as soon as i unplug the
cable I get full squelch capabilities. On the 2004 it's the opposite.
I lose the squelch completely and the audio is lower. When I plug the
cable into the 2004, all is normal. I used 10uF cap 16v in the 2004,
and a 4.7uF 50v in the 9600. Any ideas why this is happening?

Thanks

Paul...

Answer: Because Tandy sells loads of HT's at TechAmerica! They are giving HRO a run for their money here in Denver! Why introduce the replacement? They are selling what is hot today at T.A., wideband HT's (for whatever use). An HT with strictly 2m receive just won't cut it in the market for a primary HT, hams demand the newer, more advanced HT's. And they should.

Even with all this, I'd put my money on seeing a new HT in the local RS store soon enough!

TechAmerica keeps adding one Ham Radio after another to their shelves, so, by your logic, HAM RADIO MUST BE BOOMING!

This must be the "Tandy meter" we are using to judge this hobby. Give me a break!

Hi all,
This unit is already for sale here in australia, best scanner
I have ever used and only cost $A329.00. To read a test go to
http://www.strongsignals.net/htm/revr2.htm

Cheers Dan

I have the following for sale, excellent condition, postal MO only. I live in central Florida. PHOTOS and descriptions are on the attached pages.

1 - Casio QV-10A digital Camera with all accessories (cables, software, manuals, case - sell $175.00 obo

I have the following items for sale. Some I have listed on a web page that can be viewed by following the links below. All prices are not final, make reasonable offer or will consider trades.

PAGE 1
http://www.bv.net/~mcguyver/forsale1.htm
PAGE 2
http://www.bv.net/~mcguyver/forsale2.htm

*Page 2 will take a bit longer to load, some files larger.

ADDITIONAL ITEMS

BC700A 50 channel mobile scanner with AC adapter, 800MHz receive, antenna and remote speaker (EF johnson). Unit has discriminator tap jak already - $90 plus shipping

http://www.bv.net/~mcguyver/bc700a.gif

Optoelectronics R11 test receiver with stubby antenna, whip and 800 notch filter by Minicircuits, with charger and box w/instructions Sell $250.00 Unit in perfect condition

http://www.bv.net/~mcguyver/r1198.gif

Small 1mW Helium Neon laser with 12V power supply $25.00
http://www.bv.net/~mcguyver/hene.jpg

Email me with further questions. As I said in recent post, I am new to this JAVA/page composer stuff, let me know what if anything is wrong with web page.

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTES: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner, and
rec.radio.info. It is also available electronically from
the rec.radio.scanner ftp archive on the official USENET
FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

This introduction is intended for people new to the
scanning hobby and is oriented to scanning in the USA.
High level overviews of the following topics are presented:

Why Scanning?
Is Scanning Legal?
What Scanner Should I Buy?
What is a CTCSS and DCS Tone Squelch Feature?
How Do I Determine the Proper CTCSS or DCS Code?
Scanner Antennas
Coaxial Cable Feedlines
Where Can I Buy A Scanner?
Modifying Your Scanner
Scanner Repair Shops
Where Can I Obtain Frequency Information?
Do Your Own Frequency Detective Work
How Can I Use Equipment to Uncover New Frequencies?
Scanner Clubs and Mailing Lists

Why Scanning?

Every day and night, scanner hobbyists are entertained by
what they overhear on their radios. Police cars, fire
engines, ambulances, airplanes, armored cars, trains,

taxis, and buses are all equipped with radios and you can listen to them. You can monitor the local sheriff and fire departments to hear about events "as they happen," before the news reporters hear about them. Hostage dramas, bank robberies, car crashes, chemical spills, neighbor and domestic disputes, tornado sightings are all fair game. In a single afternoon, you can hear a high speed police chase, Drug Enforcement agents on a sting operation, and undercover FBI agents as they stakeout a suspect.

How about listening to a presidential candidate discuss strategy with his advisor from a 415 MHz radiophone in Air Force 1, or a team of G-men protect him while transmitting in the 167 MHz range?

Baby monitor intercoms are actually transmitters and you can hear them between 49.67 and 49.99 MHz.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots. Many midwesterners monitor the state police and and county sheriff to learn of approaching tornados long before warnings are broadcast on TV and commercial radio. Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication. Public law 103-414, signed Oct. 25, 1994, amended the law (Title 18 USC, Part I, chapter 119, sections 25110 and 2511) and outlaws listening to cordless phones, too, but many scanners cover these frequencies.

It is illegal for companies to sell or import into the USA recently manufactured scanners which cover or can be easily modified to cover the cellular phone frequencies, but sales by private individuals will still be allowed.

The rules define "readily altered by the user" as "clipping the leads of, or installing, a simple component such as a diode, resistor and/or jumper wire; replacing a plug-in semiconductor chip; or programming a semiconductor chip

using special access codes or an external device, such as a personal computer."

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted their own laws against listening to cordless phones. You can find out about these restrictions in a paperback book, Listeners Lawbook, compiled by Frank Terranella, Esq. available for $9.95 + shipping from Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend Trident nor many of the AOR brand scanners, although the AR8000 and AR3000 have good reputations and the AR5000 works well.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners have larger displays and almost always provide more audio than portables, and some portables are more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. Beware of low cost programmables which can't search. Some of the newer models, like the Uniden SportCat and Radio Shack PRO-2046, allow searching between limits, but the limits are factory programmed and cannot be altered.

Get a model which covers the 800 MHz band. Usage of the 800 - 950 MHz band is growing fast and you will miss out on the action unless your scanner covers this band.

If you're not sure whether you'll like scanning, don't want to spend much money, a 50 channel scanner will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often second rate. The $2000 Icom R8500 and AOR AR5000 models are exceptions.

Deluxe scanners can be controlled and/or downloaded by a personal computer, a feature which appeals to a small but growing number of scanner owners.

Almost all low and mid-priced scanners are prone to receiving images -- receiving the same signal erroneously on two or more frequencies. With a few exceptions, images are unwelcome due to the interference they cause, e.g., hearing aircraft transmissions while the scanner is tuned to the local police frequency. Premium quality scanners use "up conversion" circuitry, a scheme which greatly reduces, but does not eliminate, image reception.

Currently, the more popular scanners include the discontinued Radio Shack PRO-2006 base/mobiles, the Uniden/Bearcat BC200XLT (a/k/a BC205XLT), BC220XLT, BC230XLT, and Radio Shack PRO-43 and PRO-60 portables. A number of owners report problems with the Icom R1 portable and the older Uniden/Bearcat 8500XLT base and 2500XLT portable. The Uniden BC9000XLT base and BC3000XLT portable work very well and are my current favorites.

Looking for value? At $180 discount price, the 100 channel Uniden/Bearcat BC860XLT base is a good value and available at most Wal-Mart stores. The RELM HS200 portable performs very well is an excellent value at its $250 street price.

Considered by many as the best scanner ever made, the 400 channel Radio Shack PRO-2006 was replaced by the 1000 channel PRO-2035, which was replaced by the PRO-2042. The portable Radio Shack PRO-64 and PRO-60 are good performers. All five models employ up conversion and are made for Radio Shack by GRE (General Research Electronics).

CTCSS and DCS Tone Squelch Feature

Upscale scanners can be optioned with a subaudible tone decoding squelch circuit. There are two types: CTCSS (Continuous Tone Coded Squelch System) and DCS (Digital Coded Squelch). In simple terms, this feature lets your scanner ignore signals you don't want to hear.

Most land mobile two way radios, except trunked systems, transmit either CTCSS or DCS signals subaudibly along with the voice information. U.S. military field radios employ wider deviation and a 150 Hz CTCSS tone, not supported by most scanners or CTCSS decoders.

There are over 40 different CTCSS codes and you can program a specific CTCSS or DCS code into each memory channel. Using a CTCSS or DCS decoder permits your scanner to open the squelch only if the transmission has a code which matches the code you program.

CTCSS and DCS decoding offers several advantages:

1. Ignore unwanted signals on shared frequencies: It is common for several users to share the same frequency, e.g., my county sheriff uses the same frequency as Chicago Police, located about 60 miles away. I want to hear my sheriff's transmissions but don't want the scanner to stop on or listen to Chicago Police transmissions. This is especially a problem when radio propagation is good, e.g., during a "band opening," when reception range is temporarily increased.

2. Combat intermodulation interference: Helps keep out intermod and image interference from strong pagers and other signals which are not transmitted with a matching code.

3. Ignore scrambled transmissions: Many federal law enforcement agencies (FBI, Secret Service, etc) and some local police agencies employ digital voice scrambling, which sounds like white noise and is annoying to hear. The CTCSS or DCS code is sent only when the station is transmitting unscrambled, or "in the clear." You can program federal frequencies along with the proper code into your decoder-equipped scanner so you won't have to listen to the scrambled mess and only hear their transmissions when they are unscrambled.

CTCSS also goes by various tradenames: Motorola's PL (Private Line), GE's Channel Guard, and RCA's Quiet Channel. Motorola uses the tradename DPL (Digital Private Line) for its digital coded squelch.

How Do I Determine the Proper CTCSS or DCS Code?

There are a few ways to determine the CTCSS or DCS code transmitted by a station:

1. Use an outboard CTCSS/DCS reader which must be attached to the discriminator output circuitry inside the scanner. The reader has an LCD or LED display which indicates the code when a station transmits. I use a CSI model CD-1 Communications Decoder Unit, an an excellent reader which sells new for about $200. (Connect Systems Inc., Ventura, CA, 800-545-1349, www.connectsystems.com).
2. Many of the ScannerMaster guides, as well as scanner club newsletters, print the CTCSS codes used by transmitting stations.
3. On some scanners equipped with the CTCSS squelch, you can program into memory the frequency of interest. Then you "tune" slowly through all the different CTCSS and/or DCS codes until the squelch opens and you hear the dispatcher talking. This is a slow process and the station has to keep transmitting during it.
4. A slow, brute force method is to program the same frequency but a different CTCSS code into several channels and see where your scanner stops.
5. In some cases, I've actually examined the walkie-talkies I want to monitor and found the CTCSS code printed on a label on or inside the radio.

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so.

Portable scanners are supplied with a helical (spring shaped) antenna, covered by rubber. The rubberized antennas furnished with current models are too stiff and place stress on the antenna jack. Older scanners to be supplied with more flexible antennas. I prefer these alternative antennas for use with portable scanners:

1. The Icom FA-1433B dual band flex antenna, a thin and very flexible rubber antenna, is slightly longer than a stock heliflex but provides better performance.
2. The Austin Condor is a 12" long rubberized antenna available for about $30. While considerably longer than the stock antenna and the FA-1443B, the Condor is very flexible and provides VHF-high band reception superior to both. It is not designed to cover the VHF-low band, but will allow reception there at least as good as shorter antennas.
3. The "Thin-Stick" is an 18 inch telescoping antenna for extended range. It is made in USA by Smiley Antenna

Co., Inc. and is designed to cover both the 2 meter and 220 MHz bands, but its variable length means it can be adjusted for optimum performance on other bands. What makes the Thin-Stick different from an ordinary telescoping antenna is the spring between the antenna and the connector portions. The spring absorbs most of the impact if the antenna collides with an object. The street price is about $17 and it is available from Amateur Electronic Supply, Milwaukee and other retailers.

Outdoor antennas, like the Channel Master 5094A or Antenna Specialists AV-801 (recently discontinued), can extend reliable reception to 50 miles or more, depending on terrain. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be more prone to cause scanner damage due to static charge buildup because they are not at "DC ground."

Coaxial Cable Feedlines

If your antenna installation requires more than 50 feet of feedline, use RG213/U or high quality RG8/U coaxial cable. RG213/U, e.g., Belden type 8267, has a non-contaminating jacket and will last longer. Each has an outer diameter of about 13/32". Similarly sized Belden 9913 cable and clones have lower attenuation but are difficult to bend, require special connectors, and can accumulate moisture inside because they are hollow.

If you must use a small diameter cable for long runs, use RG6/U. Avoid RG58/U (7/32" OD) due to its losses at high frequencies. RG8/X (1/4" OD) is suitable for short patch cords.

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Be sure it is on sale, as Radio Shack list prices are high and their scanners are offered at reduced prices by mail order discounters.

Discount chain stores like Wal-Mart, Best Buy, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer low end scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902. For a free catalog, call (828)837-9200. Telephone (orders only): (800)438-8155. Web page is http://www.grove-ent.com

- National Electronics (formerly National Tower Company), PO Box 15417, Shawnee Mission, KS 66215. Telephone (800)762-5049, (913)888-8864. Web page is www.sound.net/~ne/

- The Ham Station, 220 N. Fulton Ave., Evansville, IN 47719-0522. Telephone (800)729-4373, (812)422-0231.

- Scanner World (Albany, NY). Telephone (518)436-9606.

- Amateur Electronics Supply (Milwaukee, WI). Telephone (800)558-0411. Web page is www.aesham.com

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Used scanners may be found at hamfests, flea markets, garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

The term "mod" is often used as shorthand for "modification." If you are handy with a soldering iron, you may be interested in modifying ("modding") your scanner to add features or enhance its performance. Be warned this usually voids your warranty and current models are difficult to service due to the small, delicate surface mount components. By federal regulation, new scanner models cannot be easily modified to tune the cellular phone bands.

The term "mod" has been narrowly used by some people to mean a change which permits a scanner to receive cellular phone frequencies. This definition is far too restrictive as there are several ways one could modify a scanner, e.g., changes to improve audio quality, adding an S-meter, expanding the number of channels, changing the earphone jack to accept stereo headphones, etc.

Modification article files can be copied from several ftp sites including the /pub/hamradio/mods directory at:

garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

Modification articles posted on Usenet seem to have a life of their own. Frequently, they are plagiarized from the Internet and compiled by book, CDROM, and magazine publishers, sometimes reworded, then sold. Hobbyists then

copy the modifications from the books, CDROMs, and magazines back onto the Internet or BBSs (bulletin board systems)!

Grove Enterprises and other companies advertise a warranted, modification for fee service.

For information on "virtual downconverter" modifications, see Steve Donnell's article in January 1995 RCMA Scanner Journal or February 1996 Monitoring Times. Reprints of articles from Monitoring Times are available for $3.00 each plus a self-addressed stamped envelope from:

Grove Enterprises,
7540 Highway 64 West,
Brasstown,
NC 28902. For a free catalog, call (828)837-9200.
Telephone (orders only): (800)438-8155.

I don't get any part of this reprint fee.

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here is one company which repairs scanners:

- G & G Communications (telephone 716-768-8151) - (www.iinc.com/ggcomm or email ggcomm@iinc.com or ggcomm@aol.com) This family owned company repairs scanners and pagers and stocks parts for several older models. G & G cannot usually repair AOR scanners due to lack of manufacturer support. G & G sells and sometimes buys old scanners and parts, too. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Repair tips for Bearcat and Radio Shack scanners are discussed in two other FAQ articles.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is Gene Hughes' Police Call Plus, published each year in 9 regional volumes by Hollins

Radio Data, and sold at Radio Shack and larger book stores. The newest editions contain abbreviated business listings, too, although callsigns and other details are listed only for local government and public safety licensees.

I also recommend the book, Monitor America, published by SMB Publishing (now known as Scanner Master Publishing), and available from Grove Enterprises for about $30. A 1100 page 3rd edition is now available. Monitor America contains several pages of police, fire, local government, news media, sports, federal government, and commercial broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA, tel. (508)655-6300) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 828-837-9200, www.grove.net) and the sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning (NatScan) is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. Early issues disappointed experienced scanner hobbyists, but it now has a good column on scanner modifications and has greatly improved its coverage of east coast frequencies since merging with NESN (North East Scanner News). The best scanner frequency

lists are often found in club publications, not commercial magazines, and are discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. The Spring 1995 edition works in DOS, Windows, and Mac environments.

Grove enterprises sells FCC license information on CDROM for $100. In the 1995 edition, fields are different than PerCon's Spectrum CDROM but the data appears to be of the same vintage. The licensee name and licensee city are used instead of the DBA (doing business as) name and transmitter city which makes query results confusing.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $5.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $34.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio systems to identify their operations with their assigned call letters either automatically or verbally, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the

scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs or Mailing List?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

Peter Laws administers an electronic mail list read by over 700 hobbyists devoted to scanners and scanning. It's called "scan-l" and for more information, read:

http://www.wildstar.net/~plaws/scan/scan-l.txt

Clay Irving <clay@panix.com> administers a scanner electronic mailing list, called "scanning." To subscribe, send an Email message to: majordomo@lists.panix.com

In the body of the Email message, put: subscribe scanning

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio and the Northeastern states, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18.50 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays, many at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about 4 PM. You must purchase a lunch since we get the room for free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members often sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. You can obtain an electronic subscription to the CARMA Newsletter. For more info, see:

http://www.TheRamp.net/shabec/carma.htm

The club's mailing address is:

CARMA
P.O. Box 2681
Glenview, IL 60025

Meetings are usually held at:

- the Destiny Restaurant, on Rand Road, in Des Plaines,

- Philly's in the shopping center at the corner Rt. 83 and 53rd St. in Willowbrook,

- The Great Escape, on Irving Park Road, Schiller Park

and at other restaurants.

All meetings are held on Saturdays at locations announced
in advance. The next meeting is December 5, 1998 at
Philly's. The 1999 meeting schedule is: Febuary 6, April
3, June 5, August 1 October 2, and December 4.

BUYING A USED SCANNER RADIO

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET groups
rec.radio.scanner, alt.radio.scanner, and rec.radio.info.
It is also available electronically from the
rec.radio.scanner ftp archive on the official USENET FAQ
library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

Abstract

This article discusses the purchase of used scanner radios
and includes these topics:

1. Motivation for buying a used scanner
2. A used scanner may be a broken scanner - where to get
it fixed
3. Evolution of the scanner
4. Obtaining crystals
5. Keyboard programmable scanners

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Introduction

Anybody with enough money can buy a brand new scanner, but
you can save lots of money if you get a good deal on a used
scanner. Hamfests are probably the best place to find used
radios, but you must be familiar with the equipment.
Hamfests are repleat with older radios you won't see in
today's catalogs.

At last count, there were over 140 scanners and monitor
receivers of various brands in my collection. I purchase
most of my receivers at hamfests or horsetrade with other

radio hobbyists.

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had sellers look me square in the eye and tell me their radio worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a mobile or base model. Portable scanners are subject to more physical abuse and many have been dropped. If a radio has been dropped, the laws of probability dictate that the first point of impact was probably a corner, so be sure to examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration, dust, and temperature extremes. This shouldn't dissuade you from buying a used mobile scanner, but be aware of possible complications.

You should have some recourse if the radio you buy turns out to be defective. For hints on fixing older Bearcat base scanners, see "Tips for Fixing Bearcat Scanners," by Bob Parnass, AJ9S, in March 1996 Monitoring Times magazine.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Radio Shack repairs scanners, and Uniden can repair newer Bearcat models but often refuses to service older models, claiming they are "unrepairable" and carving the letter "U" on the cabinet.

G & G Communications (telephone 716-768-8151) is a family owned company which repairs scanners and stocks parts and crystals for several older models. They usually don't repair AOR scanners due to lack of manufacturer support. They are located at 9247 Glenwood Drive, LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

The re-incorporated Electra Corporation, (317)326-4419, is able to effect repairs on some older (pre-Uniden) Bearcat scanners. They sell crystals, antennas, power cords, owner's manuals ($11 ea). Electra Corporation is located at 251 N. 300 W. Greenfield, IN 46140-8496.

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit, model FR-2513, in which crystals were held in a rotary "turret."

The earliest scanners, like the 1968 vintage Bearcat BCH, BCL, and BCU models, did not provide individual channel lockout capability. Electra didn't use the term "scanner" and instead called these innovative radios "business receivers." Other models, like the SBE Sentinel, employed a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM receive capability, like the flamboyant turquoise Sonar Sentry FR-103 portables, Electra's Jolly Roger, and GE's Surveyor series (see US patent 4,011,515, granted 3/8/77). Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the scanner in binary form. Some models, like the Tennelec MCP-1 (see US patent 3,961,261, granted 6/1/76), Bearcat BC-101 (see US patent 4,179,662, granted 8/4/78), and Radio Shack COMP 100, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. See US patent 4,057,760, granted 11/8/77. The GRE-manufactured SBE Optiscan (and its Sears clone) required poking or covering a series of holes in

plastic cards which were then inserted into a slot on the front panel.

Keyboard Programmable Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and older scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

All the older Radio Shack scanners were made by General Research Electronics (GRE). Uniden began making scanner models for Radio Shack in the late 1980s, and now supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. Until the mid 1980s, rivals Regency and Electra (Bearcat) built most of the scanners in their Indiana and Puerto Rican factories. Uniden, a large Japanese electronics company, purchased the scanner product lines of both competitors and moved production to Asia.

My favorite VHF/UHF receivers are the the Uniden/Bearcat BC9000XLT, the 400 channel Radio Shack PRO-2005 and PRO-2006, and the ICOM R7000, R7100, and R8500. The ICOM models are more "communications receiver" than a conventional scanner.

For portable use, I prefer Uniden/Bearcat BC3000XLT and older Radio Shack PRO-43.

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor receiver, you will probably want to buy more crystals to

cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack store or from one of the companies below. Be sure to specify the operating frequency you want and the brand and model of scanner.

Some companies may ask you to send a schematic of the scanner or require more detailed information, like series or parallel resonance, load capacitance, etc.

Electra Corporation stocks crystals for the Bearcat scanners:

Electra Corporation
11915 E. Washington St.
Cumberland, IN 46229
Phone 317-894-3229

Crystals for Bearcat and other models are available from:

American Crystal Co.
1623 Central Ave.
Kansas City, KS 66102
tel. 913-342-5493

Bomar Crystal Company
201 Blackford Ave.
Middlesex, NJ 08846
tel. 908-356-7787

Cal Crystal Lab Inc.
1142 N. Gilbert St.
Anaheim, CA 92801

published by Grove Enterprises, but views expressed in this
article are his own.]

I am often asked, "How do you find these frequencies?"
This article answers the question in various sections:

Books
Magazines
Government Records
Web Sites
Federal Radio Stations
Radio Clubs
Do Your Own Sleuthing
What Makes Station Identification Difficult?
Examine the FCC License on Premise
Examine the Labels on Radio Equipment
Examine the Antenna to Determine Frequency Band
Equipment to Determine Frequency Usage
How Can I Determine To Whom I'm Listening? - An Example
Summary
Addresses

Books

The most convenient source of fire and police frequencies
is the Police Call Plus, published each year in 9 regional
volumes by Hollins Radio Data, and sold at Radio Shack and

larger book stores for under $13. Police Call Plus is basically a computer printout of FCC license information in the fire, police, local government, and conservation services in two lists: by licensee name within state, and by frequency. A few pages of local airport and nonsensitive federal government frequencies are included. Selected business frequencies are listed, too, but without callsigns and other details.

I highly recommend Richard Barnett's book, Monitor America, published by Scanner Master Corp. A 3rd edition is available from Grove Enterprises for about $30. It is crammed full of police, fire, local government, news media, sports, national park, and commercial broadcast frequencies for all 50 states. The information was compiled mainly from members of the Radio Communications Monitoring Association (RCMA), now defunt. Monitor America contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call Plus, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The 401 page third edition is available from Official Scanner Guides (P.O. Box 525-NS, Londonderry, NH 03053). The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The longstanding source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It

is certainly not complete, nor 100% accurate, but is a good book for this difficult to obtain information.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and the sensationalistic Popular Communications magazines.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells information on CDROM for $49 instead.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100.

The PerCon Spectrum CDROM sells for under $30 and contains a handful of fields for every FCC license in the US. However, Public Safety license information contained in the Winter 1996 Spectrum doesn't appear as up to date as in the 1997 Police Call Plus.

Spectrum works in DOS, Windows, and Mac environments. One can try restricted sample searches of the Spectrum CD for free via PerCon's web page at

http://www.perconcorp.com/db_srch.htm .

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $5.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $34.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Web Sites

If you have access to the World Wide Web, you can visit dozens of sites with local frequency lists. You can look up civilian aero frequencies for specific airports at: http://www.airnav.com/airports/.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA). (See "The Government Giveth, the Government Taketh Away", by Richard Prelinger, in Monitoring Times, July 1982.)

Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'. (See "AFIO and the FOIA", by Bob Grove, in Monitoring Times, September 1982.)

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces often appears for sale at hamfests. Less often, Secret Service and FBI radios appear there from time to time, too. When you see such equipment, look over the radio for a frequency label and write down the frequencies stamped on the crystals or channel elements. Make note of any service or property tags which specify the agency or military base which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA), now out of business. There are several regional scanner clubs, spun off from the former RCMA, which hold regular meetings.

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available on the WWW page http://aosc.rpmdp.com and from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio,

or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at

the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

If you don't have a VOX recorder, consider a device like the NiteLogger II tape recorder controller, made by Benjamin Michael Industries. It connects simply between scanner and recorder and contains sound activation circuitry to trigger the recorder.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was

permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Examine the Antenna to Determine Frequency Band

You can often determine a transmitter's frequency band by the size and type of antenna used.

The Police Call Plus book contains sketches of antennas. Antenna catalogs are crammed full with antenna pictures and specifications and they are usually free. Contact Antenna Specialists (216-349-8400), Cushcraft (603-627-7877), Tessco (800-472-7373), Maxrad, Larsen Electronics (800-426-1656), and other companies in the land mobile equipment business.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and

store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, another spectrum analyzer connected to a receiver IF stage, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described earlier, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi

antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information.

REPAIR TIPS: BEARCAT SCANNER RADIOS

Copyright 1993 - 1998 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,
sci.electronics.repair, and rec.radio.info. It is also
available electronically from the rec.radio.scanner ftp
archive on the official USENET FAQ library
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.
The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

The original Bearcat scanner line was manufactured by
Electra Company, a division of Masco Corp of Indiana. In
the mid 1980s, Uniden, a Japanese company, bought out the
Bearcat scanner line and Uniden's first Bearcat scanner was
the BC800XLT model.

Most of the models discussed in this article are
base/mobile units made by Electra during the 1970s and
1980s although some of the capacitor failures occur in the
Uniden BC800XLT, too.

Electra stamped all of its scanners with a manufacturing
date code on the rear of the cabinet. The code is comprised
of a single character (C = Cumberland, Indiana, P = Puerto
Rico), followed by four digits denoting year and week the
radio was built. For example, "P8422" denotes the radio was
made in the Puerto Rico factory during the 22nd week of
1984.

One way to roughly estimate a radio's age is to examine the
4 digit date codes often stamped on the integrated
circuits. The radio must have been made after the most

recent date stamp.

Schematics, Owner's Manuals, and Parts Available

The re-incorporated Electra Corporation is able to effect repairs on some older (pre-Uniden) Bearcat scanners. They sell crystals, antennas, power cords, owner's manuals ($11 ea). Electra Corporation is located at 11915 E. Washington St., Cumberland, IN 46229. Phone 317-894-3229.

I cannot furnish schematics, manuals or parts. To order a user manual for an Electra/Bearcat scanner from Uniden, call (800)235-3874 extension 2553. You can also download | an electronic copy of the user manual for recent Bearcat | models from the Uniden web site: |

http://www.uniden.com/docs/service/support.htm |

Some schematic diagrams may be obtained from Uniden's parts | department, (800)297-1023. Uniden currently charges a flat rate of $54 for scanner repairs. They will repair and return "out of warranty" items without an estimate unless the repair charges exceed the flat rate charges.

The phone number for repair is (800)297-1023, too. I recommend you call repair before sending the broken scanner. Items for repair via UPS (include receipt if still under warranty) are usually sent to:

Uniden America Corp.
4700 Amon Carter Blvd.
P.O. Box 95002
Fort Worth, TX 76155

If Uniden doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267, http://www.hwsams.com/sams_model_new.html

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 9247 Glenwood Drive, LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

Common Construction

Most of the classic, metal-cased Bearcat base/mobile models were built using two printed circuit boards:

1. a "radio board" containing the synthesizer, RF, IF, and audio stages, and

2. a "feature board" containing the microprocessor controller and memory circuitry which gave each model its own personality.

Although there are various vintage radios boards, they all have similar circuitry.

Bad Solder Joints Common

Before addressing specific symptoms, circuit boards in the malfunctioning scanner should be inspected for poor solder joints.

The Electra/Bearcat BC350, BC300, BC250, BC220, BC20/20, BC211, BC210, and BC210XL models were hand assembled, and every one I've serviced had several connections that were either soldered poorly, or not soldered at all.

Resoldering joints on the ribbon cable connecting the RF and keyboard logic circuit boards in a BC250 attenuated the microprocessor/synthesizer hash noise noticeably.

A Bearcat 20/20 was experiencing periodic loss of memory on some, but not all channels. When the problem occurred, the frequencies on some channels would be completely changed. On other channels, the frequency would still be intact, but the channel would be locked out, and the delay toggled from "on" to "off". Some channels were not affected.

The 2 "AA" memory backup batteries, and their holder, tested good. Much time was spent tracing logic, heating and cooling components, and making voltage measurements.

One of the secondary leads from the power transformer was connected to the main circuit board through a hole drilled through foil traces on both the top and bottom sides of the board. A close examination revealed that this lead had been soldered only on the top of the board - the bottom side had never been soldered.

Soldering the lead on both sides of the board solved the memory loss problem.

Matt Roberds fixed a BC220 which experienced memory loss if power was removed by resoldering the positive wire to 2-AA battery holder.

As built, the BC220 logic board is grounded only through its mounting screws. In the BC220, Matt recommends adding real wire ground jumpers from the main board to the feature (logic) board to fix grounding problems.

Symptom: Blank Display

The BC300 scanner, and several other Bearcat models, employ a switching type power supply stage to generate plus and minus voltages in excess of 20 volts DC. When this switcher fails to function, the display goes blank, but the squelch control appears to work, and white noise can be heard in the speaker.

In almost a dozen of the BC300 and BC800XLT scanners I've fixed, C98, a capacitor in series with the primary of the switching transformer failed, causing the output of the supply to drop below the level needed to power the display. The switching transformer is mounted on the RF circuit board, and is much, much smaller than the main power transformer, which is usually fastened to the metal chassis. See March 1996 Monitoring Times magazine for BC800XLT capacitor locations and repair information.

The 22uF/16V capacitor used for C98 in early BC300s was marginal, and was replaced with a 47uF/25V capacitor in later units.

Jim Craig replaced a 22uF/35V C98 capacitor to repair his BC210XW.

Paul Grohe replaced a failed C98 with a low ESR (equivalent series resistance), high frequency, switching regulator grade capacitor, e.g. a Panasonic HF series capacitor. He also recommends adding a 0.1 ceramic capacitor in parallel with C98.

I replaced the 22 uF capacitor in the switching power supply stage of a BC210XL which caused the same symptom. Other capacitors in the switcher stage have failed. C114, a 4.7 uF/35V tantalum capacitor failed in at least one BC250, causing the display to blank.

A more sinister problem affects the switcher in earlier models. The switching supply stage in the BC250 and original BC210 is driven by a clock signal derived from a custom Exar NC57902 divider integrated circuit (designated IC6 in the BC250 scanner). I've seen this divider IC fail in several BC250s, causing a blank display (except for a decimal point in the BC250's rightmost digit). This custom IC is no longer available from Uniden.

Failure of IC9, the 9 volt NJM78M09A regulator in a BC800XLT is another cause of a blank display.

Symptom: Invalid Frequency Displayed

A common Bearcat 250 malady is manifested by an invalid frequency displayed on the readout. This condition is temporarily "cured" by unplugging the AC line cord from the wall, then replugging it. This condition is symptomatic of

a power supply problem in which Q204, a Texas Instruments TIP-29 located on the feature circuit board, fails.

A Philips ECG291 will work as a substitute for the TIP-29. Don't try a Radio Shack substitute, it hasn't worked. See Martin Toomajian's article, "Bearcat 250 Erratic Display Cure", in January 1987 Monitoring Times.

A similar problem in the Bearcat 20/20 was discussed previously in the section on bad solder joints.

Matt Roberds repaired the Montgomery Wards version of a BC220 and contributed these insights:

"I did add some heat-sinks, but you have to be careful what you do with the TIP29 on the logic board. I added a long, flat heatsink to it and immediately created a whine in the audio. I didn't use an insulator, as this was a temporary first-try. As far as I can tell, the heatsink was radiating noise from the logic board into the front end on the radio board, which ended up being just below the heatsink. Bypassing the TIP29 (a voltage regulator) with disc ceramics didn't work; using a smaller heatsink and an insulator fixed the problem."

"There is also a 220 ohm 1/4 watt resistor on the logic board. It feeds the TIP29 from the main +16v supply. It looked a little crispy. I pulled one end and measured the current through it and it was about 30-35 mA. This works out to right at 0.2-0.25 watt dissipation. I didn't have a higher-wattage resistor, so I substituted 2 470-ohm resistors in parallel."

Symptom: Squelch Won't Eliminate White Noise

Most Uniden/Bearcat base/mobile scanners feature an AUTO squelch position, actuated by rotating the squelch knob fully counter clockwise. The BC350 used a separate pushbutton switch for this purpose. These scanners use a flimsy potentiometer (designated R81 in BC300s) internally mounted on the RF circuit board, to set the level of signal required to open the squelch when in the AUTO position. This pot also has an effect on the squelch action in the non-AUTO mode, and determines at which point the squelch knob must be positioned in order to silence the radio.

Although the potentiometer is adjusted at the factory, changes in component values due to aging often necessitate readjustment of this internal pot. Misadjustment of this pot has been the cause of "no squelch" complaints in two BC300s and a BC250 I fixed.

Another squelch failure is due to a blown transistor that acts as the electronic switch in the squelch circuit. I replaced this transistor in only one BC300, so I don't know if this is a common problem.

Symptom: Scanner Completely Dead

In Bearcat scanners using an internal power supply (e.g., BC350, BC250, etc.), the main power transformer is connected directly to the AC line. Since the on/off switch is on the secondary side of the transformer, current flows in the primary as long as the AC line cord is plugged into an active AC outlet. These transformers contain an internal circuit breaker, not visible without unwinding (destroying) the transformer. The internal breaker is known to fail prematurely in a batch of Bearcat power transformers.

If your scanner is completely dead, check the primary of this transformer for an open circuit condition.

Symptom: Keyboard Bounce

After much use, the Chromerics keyboards in Bearcat scanners start to wear out. The first sign of trouble is usually keyboard bounce on the most frequently used key, e.g., the MANUAL key. Replacement keyboards are usually available from UNIDEN, but replacement requires dexterity, as one must take care not to tear the flat, flexible strip connecting the keyboard to the logic board.

Symptom: Keyboard Completely Unresponsive

The keyboard matrix is "scanned" by the microprocessor. Another problem is when none of the keys seems to function; the receiver just keeps scanning in spite of key depressions. I found this condition in a BC210XL scanner owned by a heavy smoker. Perhaps nicotine smoke was to blame, as the resistance between two input port pins on the microprocessor was down to about 1000 ohms, fooling the microprocessor into believing that a key was stuck in the "down" position. Scraping the circuit board between the two pins with an X-Acto knife fixed the problem.

Uniden/Bearcat BC200XLT Portable
Loss of Audio and Dial Lamp

If you can program frequencies into your BC200XLT but there is no audio and the green backlight no longer functions, a tiny transistor may have failed.

Check for a defective PNP surface mount transistor, Q201 (2SB815B6-YDY). Q201 is used as a switch to furnish 8 VDC to several stages of the BC200XLT. Its main purpose is to

switch off power hungry stages of the BC200XLT when the CPU thinks the NiCd voltage has fallen below a threshhold. That's an attempt to limit the current drain on weak NiCds to avoid permanent damage.

Q201 is located on the foil side of the "Micom" board, adjacent to the black multi-pin connector which mates the Micom and main boards together.

Q201 can be destroyed by a few different causes, primarily, by something in the scanner drawing too much current through it. In one case, capacitor C36 shorted. It's a 220 uF 10v electrolytic, located on the component side of the main board, connected from pin 8 of the audio IC (IC2 NJM386SL) to ground. Capacitor C55 shorted in another BC200XLT. Gary Bean reports he substituted a 2SA1298 for Q201 and it worked fine. In a pinch you bypass Q201 by soldering a short piece of bare wire between the collector and emitter, but you must first fix the component which caused Q201 to fail.

BC9000XLT: Loss of Sensitivity

John Ward has fixed two BC9000XLTs which suffered from "low sensitivity." He fixed the solder joint where the antenna jack connects to the circuit board. In both cases the tab from the board was on the opposite side of the jack from where the little blob of solder applied at the factory was located.

It was an intermittent problem that depended upon the position of the antenna cable - if the weight of the cable placed tension on the jack in one direction contact was made and the radio worked fine. If the cable placed tension on the jack in the opposite direction contact was lost and so was reception. The gap was barely noticeable.

Other Problems

Complaints of low audio output and occasional microphonics in three Uniden/Bearcat 800XLTs were caused by a bad 47 ufd electrolytic capacitor in series between the external speaker jack and audio amplifier.

Andy Domonkos reports he often uses a tape recorder connected to a Uniden/Bearcat BC890XLT. RL-1, the carrier activated relay inside the BC890XLT wore out. Andy found the identical relay sold at Radio Shack (part #275-232) and says the BC9000XLT uses the same relay, too.

Replacement Bulbs for BC760XLT

The Uniden BC760XLT's SCAN, MAN, PRI, and HOLD buttons are illuminated by "grain of wheat" type incandescent bulbs. Gary Saffer reports that the bulbs and buttons are located on a small printed circuit board which sits behind the radio's face plate. Gary unsoldered the burned out bulbs in his radio and replaced them with 12 volt Radio Shack bulbs (#272-1092c). They should last a long time when powered by the 8 VDC supplied by the BC760XLT.

Open Resistor in BC140

Robert Casey fixed his deaf, 16 channel Bearcat BC140 scanner. A 10 ohm resistor had opened that fed a circuit that generates 22V for the varactor diode tuner circuits. Without the 22V, there was no tuning of the local oscillator and front end, and no reception. What he did was compare voltages to a second working BC140.

Sources for Replacement NiCd Battery Packs

Replacement NiCd battery packs and inserts for the BC100XLT, BC200XLT, BC2500XLT, BC3000XLT, and other scanners are available from Uniden. I've purchased them at lower cost from:

1. Mr. NiCd - E. H. Yost and Company, 2211-D Parview Rd., Middleton, WI 53562. tel. (608)831-3443. email ehyost@midplains.net

2. Battery-Tech Central, 2818 Southland Street SW, Cedar Rapids, IA 52404-4141. tel. (800)267-3087 or (319)364-0855. email rlassoc@inav.net

Batteries Plus has stores across they country and some have rebuilt Uniden NiCd packs for under $20.

Add a Plectron or Motorola Alert
Desktop Monitor Receiver
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author.]

In the 1960s and 1970s, thousands of firemen and ambulance
squad members came to rely on their crystal controlled,
transistor Plectron and Motorola desktop monitor receivers.
They have now been replaced by battery operated portable
pagers, and the desktop models are often available at
hamfests in the $5 - $25 range. Since many are in rough
condition and need repair, a hamfest special is better
suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are
excellent for dedicated monitoring of local frequencies --
a task for which you wouldn't want to tie up your 400
channel programmable scanner. They are desktop models
which can be powered from 117VAC or 12VDC with the proper
mobile cord. The audio quality of a Plectron P1, Plectron
700 series, and Motorola Alert Monitor is far better than
any consumer grade scanner and the sensitivity, image
rejection, and intermod immunity is outstanding when
aligned properly.

Models and Frequency Coverage

The Plectron and Motorola Alert monitors are single band
receivers: VHF-low, VHF-high, or UHF. No single Plectron
or Motorola Alert monitor can cover the entire 30-50 MHz
band, so there were versions optimized for each portion of
the VHF-low band. There were different versions to cover
low and high "splits" in the VHF-high band, too. For
example, low band R8000s come in 30 - 35, 35 - 39, 39 - 49,
and 49 - 54 MHz versions. There are two VHF high band

versions of the 700 and R8000: 148 - 158 and 158 - 175 MHz.

VHF-low band Motorola Alert monitors come in two splits: 30 - 42 and 42 - 54 MHz.

Although UHF versions of the 700 series were made, they are somewhat rare and coverage is limited to 470 MHz and below.

Plectron made several models with dozens of different options. Both the original P1 and later 700 series are suitable for restoration, although I prefer the newer 700 models. The 8000 series were even newer and very desireable, but they are difficult to find at hamfests. The Plectron 500 "economy" series is less desirable.

The P1 series have black cabinets with a blue-green and silver color scheme used on the front panel. They were made in the Chief (tone decoder & carrier squelch), Patrol (carrier squelch only), and Sentry (tone only) models. The Sentry models lack a carrier squelch and therefore are of little use to hobbyists except for scavenging parts. Model number and frequency information appears on a gummed label on the rear panel:

Band (MHz) Chief Patrol Sentry

_____
25-54 R19 R15 R17
148-174 R20 R16 R18
450-470 R23 R21 R22

Table 1. Plectron P1 models

The R700 series have black cabinets with brown front panels and are slightly smaller than the P1 receivers. R700s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
25-54 R719 R715
148-174 R720 R716
450-470 R723 R721

Table 2. Plectron 700 models

The R8000 series are much smaller than the P1 and R700 and are housed in metal cabinets of various colors. The R8000s use the same MC3357 IF/detector/squelch IC used in crystal scanners, but their crystals are not interchangeable with ordinary scanners. R8000s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

30-54 R8190 R8150
148-174 R8200 R8160

Table 3. Plectron 8000 models

The Plectron FM Receiver/Recorder is a collector's item. It is essentially a 700 series Chief receiver with a built in cassette tape recorder. The recorder is carrier activated and can tape transmissions while the receiver is unattended. A connector on the rear panel allows for all kinds of remote control possibilities.

I use two Plectron P1s and four R700s in my living room, seven R700s down the basement, and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks downstairs. Power to them is controlled by a modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I cleaned, fixed, and restored each one. After recrystalling them on local frequencies, I distributed them to members of my scanner club who were glad to get them. |

Crystals |

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

The best source for crystals is:

International Crystal Mfg Co.
11 N. Lee Ave
Oklahoma City, OK 73102
tel. 405-236-3741, 800-725-1426

You need not bother with calculating the crystal | fundamental frequency. Merely supply International with the exact receiver model number, printed on the rear label, and the frequency you want to monitor. They will perform the necessary calculations. |

Crystals for Plectrons |

The Plectron P1 series contain two crystals. The second | local oscillator crystal is 11.155 MHz regardless of band. |

On VHF high band (148 - 175 MHz), the P1 series employ this |
formula for the first local oscillator crystal: |

Crystal frequency (MHz) |
= (station freq (MHz) + 10.7) / 4 |

or |

Crystal frequency (MHz) |
= (station freq (MHz) - 10.7) / 4 |

On VHF low band (25 - 54 MHz), the P1 series employ this |
formula for the first local oscillator crystal: |

Crystal frequency (MHz) = (station freq (MHz) + 10.7) |

or |

Crystal frequency (MHz) = (station freq (MHz) - 10.7) |

There are two crystals (Y1, Y2) used in the Plectron R700 |
series, one for each local oscillator. The crystal |
formulas are: |

RF Range (MHz) Y1 (MHz) Y2 (MHz) |
_____ |
25-29 (f+10.7)/3 11.155 |
29-32.6 (f+10.7)/3 11.155 |
32.5-35 (f-10.7)/2 10.245 |
35-41 (f-10.7)/2 11.155 |
41-47 (f-10.7)/2 11.155 (use 10.245 MHz |
for Y2 on 44.62 MHz) |
47-54 (f-10.7)/3 11.155 |
148-158 (f-10.7)/9 11.155 |
158-175 (f-10.7)/9 10.245 |
450-470 (f-10.7)/18 11.155 |

The economy Plectron 500 series use this scheme for the |
first local oscillator crystal: |

RF Range (MHz) Crystal (MHz) |
_____ |
25 - 35 (f+10.7) |
35 - 54 (f-10.7) |
148 - 174 (f-10.7)/4 |

Most Plectron 500s use an 11.155 MHz second local |
oscillator crystal. However, a 10.245 MHz crystal is used |
instead for receivers in these ranges: 33.4 - 33.78, 44.62, |
and 158.78 - 158.82 MHz. |

Power Cords |

AC power cords for both types of receivers use unique
connectors and are scarce. I published the pinout for both

Plectron and Motorola Alert Monitor receivers in June 1998 Monitoring Times magazine.

You can buy the proper replacement power cords but it's much cheaper to drill a hole on the rear panel and solder on a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak. |

Squelch and Minimum Volume Setting |

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81. *

Both Plectron and Motorola Alert monitor receivers are designed purposely to have a minimum volume setting which is still audible. The intent was to prevent firemen from turning the volume down completely, forgetting it was down, then missing an important call.

This "feature" was usually implemented by having a fixed value resistor in series between one end of the volume control and ground. In the R15X5, R14X5, R15X5, and R16X5, a 47 ohm resistor, designated R624, was inserted in series with the violet wire leading from the volume control.

You could decrease the lowest volume setting by decreasing the value of this fixed resistor. Alternatively, you could replace the resistor with a jumper wire to completely silence the receiver at minimum setting of the volume control.

Tone Alert Feature

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain.

Repair and Replacement Parts

Repair service and replacement parts for the Plectron P1 and R700 models is offered by:

Weber Electronics
PO Box 212
5138 Laurel Ln.
Broad Run, VA 20137
telephone (540) 347-7760
email: weber@citizen.infi.net

You can also obtain Plectron repairs and parts from:

Northeast Communications
4 Oak Ridge Rd
Newfoundland NJ 07435
201-697-8804

Alert Monitor parts are available from Motorola. Phone (800)972-3226.

Plectron SM-series Scanning Receivers

Plectron also sold an SM series of scanners, manufactured in Japan by the same folks who made Craig (division of Pioneer) scanners. The SM series are consumer-grade models and are included in this article for the sake of completeness. They are crystal controlled radios and feature priority scan and a separate trimmer capacitor for each channel to net the crystals on frequency.

Band Frequency Limits

VHF-low 30 - 50
VHF-high 150 - 174
UHF 450 - 470 MHz

Table 4. Plectron SM Model Band Limits

Model	UHF	VHF-high	VHF-low
SM-301	X	X	X
SM-302	X	X	
SM-303	X	X	
SM-304	X	X	

Table 5. Plectron SM Models

The crystals used in the SM series are quite different from the crystals used in the conventional single channel Plectron monitors. Here are the crystal formulas:

VHF low band:
crystal 3rd overtone freq = receive freq + 10.7 MHz

VHF high band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz)/3

UHF band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz) /
10

Other crystal specifications for the SM series are:

CR 25/U holder
3rd overtone
20 pF load capacitance
parallel resonant
max series resistance 40 ohm
max drive 2 mW

Plectron Alternatives |

Too bad Plectron is out of business. If you wish to |
purchase a new receiver with "Plectron-like" signaling |
capabilities, contact Reach Electronics: |

Reach Electronics |
1311 West Pacific |
Lexington, NE 68850 |
(308) 324-6661 |
(800) 445-0007 |
FAX: (308) 324-4985 |

Reach sells tone & voice pagers, Alert monitors, and |
ENCODERS. They also do contract manufacturing. |

I currently have no Plectrons or Motorola Alert Monitors
for sale. I'm hoarding them. :-)

REPAIR TIPS: RADIO SHACK SCANNER RADIOS

Copyright 1997 - 1998 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,
sci.electronics.repair, and rec.radio.info. It is also
available electronically from the rec.radio.scanner ftp
archive on the official USENET FAQ library
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.
The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

Radio Shack has been selling scanners and monitor receivers
under the Realistic and Radio Shack labels for over 30
years. Most of them were manufactured by General Research
Electronics of Tokyo, though many newer models are
manufactured by Uniden.

The date of manufacture is usually printed on a gummed
label on the scanner as well as the cardboard box. A code
of 12A5, means the scanner was made in the 12th month of
1975, 1985, or 1995, for example.

There's another way to date Radio Shack scanners
manufactured by Uniden. The first digit of the long serial
number is usually the last digit of the year of
manufacture.

Another way to roughly estimate a radio's age is to examine
the 4 digit date codes often stamped on the integrated
circuits. The radio must have been made after the most
recent date stamp.

Schematics, Owner's Manuals, and Parts Available

I cannot furnish schematics, manuals or parts. Service manuals for most Radio Shack scanners sold through mid-1997 may be ordered through your local Radio Shack store.

If Radio Shack doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267, http://www.hwsams.com/sams_model_new.html

Parts lists for recent and many older models are available on line at: http://support.tandy.com. Parts may be ordered through Tandy National Parts, telephone (800)442-2425 or (817)870-5600, or through your local Radio Shack store

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 9247 Glenwood Drive, LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

GRE-Built Base Models: Dim Backlight

The backlight in many base models, including the PRO-2022, PRO-2004, and PRO-2005/6 is implemented by an electroluminescent panel, which grows dim with use.

The EL panel used in the PRO-2005 and PRO-2006 is designated EL-501, and is identified by Radio Shack part #10800050. A new EL panel can be ordered through your Tandy National parts (see above) or local Radio Shack store and sent to your home. Radio Shack no longer sells replacement EL panels for the PRO-2004.

Replacing the backlight is an operation which requires care and patience. Purchase a service manual, and study the exploded parts diagrams as you read the following steps.

Top and bottom cabinet pieces must be removed, then the speaker unplugged from the main board. The front panel assembly must be removed from the chassis by removing 4 flat head screws, 2 on each side. You need not disconnect all the wiring harnesses, though you might have to unplug one so it won't get in the way of a hot soldering iron.

Unsolder the bare ground wire soldered to a large shield on the back of the front panel, located near the back of the squelch control. Two ground braids must be temporarily disconnected by removing the screws which fasten them to the chassis. After removing the volume and squelch knobs, you must remove 8 small screws which fasten the plastic front panel to the diplay board.

The old EL panel is fastened by a bead of glue and two foil type leads soldered to the display board. It's easier to cut the two leads from the old EL panel before unsoldering. A sharp knife should be used cut away the glue. The old EL panel can then be slid gently out from behind the LCD display.

The new EL panel can be installed by reversing the process, though I found that it is not necessary to glue the new panel. The two foil leads must be soldered using a minimum of heat. Reassemble the pieces in reverse order of disassembly.

GRE-Built Portables: Worn Out Keypads

The keypad on late model GRE-made Radio Shack portables, e.g., PRO-39 and PRO-43, can become unreliable after prolonged use. The best repair is to replace the rubber keypad instead of trying to restore contacts using chemicals. A replacement rubber keypad may be ordered inexpensively through Tandy National Parts or your local Radio Shack Store.

PRO-43: Loss of Audio

Early PRO-43s were built with a 200 mW speaker (mfr's part #EAS-3P123A). The voice coils in some of these speakers have opened, resulting in lack of audio output, though audio is still available from the earphone jack. A more capable 500 mW speaker is available through Tandy as replacement (EAS-3P127).

PRO-43: Freezup

If you attempt to lock out all 20 channels in a memory bank, then scan only that bank, your PRO-43 will freeze up and be placed into a catatonic state. Use the procedure documented in the PRO-43 user manual to fully reset the scanner. This will "break the trance," but all the memory channels will be cleared.

PRO-2004: Dead

If your PRO-2004 is completely dead, check R235, a 1 ohm, 1 watt resistor mounted vertically on the main board.

PRO-7A: Channels 1 - 4 or 5 - 8 Dead

If the first or last 4 channels in your 8 channel PRO-7A crystal scanner are not working and the lamps for those channels won't light, replace IC4 or IC5 (type 7400A).

IMPROVE THE SQUELCH IN YOUR MONITOR RECEIVER

Copyright 1988 - 1999 by Bob Parnass, AJ9S

[NOTE: The first version of this article appeared in the RCMA Newsletter, December 1988. It may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, sci.electronics.repair, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.]

The squelch control in some FM monitor receivers is difficult to use because of too much hysteresis. The American Heritage Dictionary of the English Language defines hysteresis as the:

o "Failure of a property changed by an external agent to return to its original value when the cause of the change is removed."

It's like having play in a car's steering wheel, or backlash in a gear set. Too much hysteresis in a squelch circuit forces one to keep the squelch at a tighter setting, missing weaker signals when scanning or searching. The squelch hysteresis problem was first addressed in a 1984 article about the Radio Shack PRO-24 crystal controlled scanner.

Why do engineers design these circuits with any hysteresis? Basically, hysteresis prevents weak signals from "popping" the squelch open and closed rapidly, which would be very annoying to the listener. A squelch circuit with hysteresis requires a stronger signal to open the squelch than it does to keep it open.

Models cursed with too much hysteresis include the Uniden/Bearcat 800XLT and 760XLT, Radio Shack PRO-2003, PRO-2004, and others. Don't despair, the fix is simple for most radios. I've successfully reduced the squelch hysteresis by replacing a single resistor.

Hysteresis is usually implemented by providing feedback from the squelch gate input to output, through a resistor. The higher the resistor value, the less feedback there is, and less hysteresis. My modification involves replacing the "stock" resistor with a higher value resistor, as identified in the table below.

This technique does not apply to some of the newer Uniden models, because the squelch hysteresis is partially determined by firmware inside the processor IC.

This article cannot provide step-by-step instructions for each radio. I always encourage radio hobbyists to purchase the service manuals for their equipment. The most useful sections of the manual are the schematics and printed circuit diagrams. Good manuals will also describe the theory of operation and alignment procedures, and contain a complete parts list.

If your radio has too much hysteresis, and is not listed in the table, study the service manual. Motorola MC3357, MC3359, and MC3361 integrated circuits, which contain IF and squelch circuitry, are popular in scanners. In these receivers, look for the hysteresis resistor to be connected to these ICs.

Notes

1. The author cannot furnish modification information for other radios.

2. Don't attempt this, or any other internal modification, unless you are skilled in electronic servicing.

3. Make sure your receiver is disconnected from any power source before opening the cabinet.

4. If space permits, you can replace the stock resistor with a higher value variable resistor ("trimpot") and adjust to suit.

Table 1. Squelch Hysteresis Resistor In Selected Receivers

Squelch Hysteresis Resistor In Selected Receivers		
Receiver Model No.	Res-istor Value	Stock Comments
Radio Shack PRO-24	R35	33K replace with 220K. Located between pins 12 and 14

	of MC3357 (IC1)
Radio Shack PRO-2002	R197 47K try 220K.
Radio Shack PRO-2004	R148 47K remove R148
	or replace with 220K.
	On linear board,
	between pins 12 & 14
	of TK10420 (IC2)
Radio Shack PRO-2006	R152 33K try 100K or higher.
Radio Shack PRO-2022	R91 33K replace 33K
	with 220K.
	Between pins 12 & 14
	on IC-1 MC3361
Radio Shack PRO-2035	100K replace 100K
	with 220K.
	Between pins 12 & 14
	of TK10420 (IC-2)
Electra/Bearcat 220	R75 2.7M may be ok as is
Electra/Bearcat 20/20	R75 2.7M may be ok as is
Electra/Bearcat 250	R66 2.2M may be ok as is
Uniden/Bearcat 760XLT	R58 22K replace with 6.8K
	or other value.
	(select value for
	the particular radio.)
	Located on pin 14
	of MC3359P IC
Uniden/Bearcat 800XLT	R91 860K replace with 2.2M.
	Located on pin 14
	of MC3359P IC
Plectron P1	R81 180K may be ok as is
Plectron 700	R96 180K replace with 560K

group/rec.radio.scanner.]

Abstract

This article contains product review summaries for more than
70 old and new scanner radios and monitor receivers.

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Introduction

At last count, there were over 140 scanners and monitor
receivers of various brands in my collection. This article
describes a few of the FM receivers in my collection, and
other models I've tested. It is not meant to be complete.

For more information about old scanners, see:

1. "Confessions of a Scanner Collector," by Bob Parnass,
Monitoring Times, August 1988.

2. "Scanner Collector Primer," by Bob Parnass,
Monitoring Times, May 1995.

I have published full length reviews and modifications of
these scanner models in Monitoring Times magazine:

Mar 1986 - Uniden/Bearcat BC800XLT
Mar 1987 - Radio Shack PRO-2004

Oct 1990 - Radio Shack PRO-2006
Jan 1995 - Radio Shack PRO-2035 vs. Radio Shack PRO-2006
Feb 1995 - Radio Shack PRO-62 Portable
Mar 1995 - Uniden/Bearcat BC9000XLT
Apr 1995 - Uniden/Bearcat BC3000XLT Portable
May 1995 - Uniden/Bearcat BC860XLT
Jun 1995 - Uniden/Bearcat BC890XLT & Radio Shack PRO-2036
Jul 1995 - Radio Shack PRO-2037
Aug 1995 - Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT
Sep 1995 - Radio Shack PRO-60 Portable
Oct 1995 - AOR AR-2700 Portable
Nov 1995 - selected AOR AR-8000 measurements
Dec 1995 - Radio Shack PRO-2040
Feb 1996 - Radio Shack PRO-2042
Apr 1996 - Uniden/Bearcat BC220XLT, BC230XLT Portable
Jun 1996 - modifications & tips for the Uniden/Bearcat BC9000XLT
Jul 1996 - Uniden/Bearcat BCT-10 mobile
Oct 1996 - Radio Shack PRO-2046 mobile
Dec 1996 - AOR AR5000
Jan 1997 - ICOM R8500
Feb 1997 - Radio Shack PRO-2045
Mar 1997 - ICOM IC-R10
Apr 1997 - RELM HS-200 portable
May 1997 - Uniden/Bearcat BCT7 virtual downconversion mod.
Jul 1997 - Uniden/Bearcat BC235XLT portable Trunktracker
Aug 1997 - Radio Shack PRO-64 portable
Sep 1997 - Stridsberg Engineering receiver multicoupler,
G/Wiz board for EDACS trunked scanning
Oct 1997 - Radio Shack PRO-67
Nov 1997 - Sporty's JD-100 Air Scan
Dec 1997 - Uniden/Bearcat BC895XLT Trunktracker
Mar 1998 - RELM MS-200 mobile
Apr 1998 - RCA RP-6150 portable
May 1998 - Radio Shack PRO-2050 base Trunktracker
Jun 1998 - Opto DC442 CTCSS/DCS/DTMF display
Aug 1998 - Sony SC1PC portable
Oct 1998 - AOR AR8200 portable
Nov 1998 - Alinco DJ-X10T portable

Note: Reprints of Monitoring Times articles are available for $3.00 each plus a self-addressed stamped envelope from Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902, tel. (800)438-8155. I don't receive any part of this reprint fee.

AOR

AR2700: 1995 vintage. 500 channel portable covering 500 kHz to 1300 MHz. Lots of good features, e.g., 10 linkable search banks, lighted keypad, per-channel attenuator, S-meter, battery meter, optional voice recorder and speech

inversion descrambler. Global rescan and pause delays, but no auto store, data skip, nor battery saver. Internally generated noise results in broad birdies on AR2700 tested. Insensitive carrier operated (vs. noise operated) squelch stays closed on signals unless they are moderately strong, causing scanner to skip transmissions of interest. IFs are 287.55/749.25, 58.05, 10.7/0.455 MHz. See "The AOR AR-2700 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, October and November 1995.

AR5000: 1996 vintage. approx. 30 kHz - 2600 MHz coverage super receiver. Good sensitivity throughout. AM, SSB, CW, FM detectors. Frequency readout to 1 Hz. More features than any other radio. DTMF reader and RS-232 interface included. Multiple settings for IF and AF selectivity, attenuator, AGC, deemphasis, etc. DB9 RS232C connector. Negatives include low contrast LCD display and difficult user interface. NFM squelch closes slowly, causing noise burst at end of each NFM transmission. Electromechanical relays click at various frequency boundaries, including 400 MHz, producing a clickety-clack noise -- annoying while scanning banks of mixed band frequencies. Great radio, otherwise. See "AOR's AR5000 All-in-One Receiver," by Bob Parnass, in Monitoring Times, December 1996, for a review which includes quantitative test results.

ICOM

R-10: late 1996 vintage (serial number 01048 tested). Shirt pocket size multimode is powered by 4 AA penlight cells. Covers 0.5 to 1300 MHz (minus cellular). NFM, WFM, USB, LSB, AM, and CW detectors included. IF bandwidths are fixed. No 30 kHz bandwidth for satellite or FM military monitoring. Battery saver circuit, with selectable duty cycle. Single VFO and 1000 memory channels. There are 900 memory channels divided into 18 banks of 50 channels each. Another bank of 100 channels used to hold unique frequencies found during an auto store operation. 20 pairs of search limits. Up to 100 frequencies may be locked out during a search and stored in a final bank of 100 channels which is cleared before subsequent auto store searches. Each channel can be programmed with the detector mode (e.g., AM, USB), a tuning step size, an attenuator enable flag, and an 8 character label. CI-V computer interface requires extra cost hardware. 7 segment S-meter. Noise blanker. Good sensitivity. Lighted keypad and display, but keystroke sequences are cumbersome.

Good radio hardware in a handy sized package, but scanning performance unimpressive. Very slow memory scanning at only 6 channels/second. Searches at about 16 steps/second, with

little or no worthwhile improvement using the "Signal Navigator" feature in the R10 I tested. Rescan delay cannot be disabled. Can only scan one memory bank or all banks, not a combination of banks. No squelch for SSB or CW modes. See "ICOM IC-R10 Receiver," by Bob Parnass, in Monitoring Times, March 1997, for review which includes quantitative test results.

R-7000: 1986 vintage. At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin 19 of memory IC8. Tuning knob lets you tune through parts of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful search and store feature, reminiscent of the the Bearcat 250, searches between 2 limits and automatically stores new frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: 1992 vintage. At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to scan. 10 pairs of search limits. Search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. R7100 has 2 VFOs ("windows"). Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Both the R7100 and R7000 employ a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the ICOM user with a very annoying clickety-clack, clickety-clack! For Baseband Audio out, I mounted an RCA jack on the back of the R7100A and connected it via shielded cable to the junction of resistors R228 and R230 on the Main Unit. This point is located in the vicinity of IC15 and X3 on the

schematic.

R8500: 1996 vintage. 100 kHz - 2000 MHz coverage. 20 banks of 40 channels although bank sizes can be changed. 100 Auto store and 100 Skip memories but that can be increased by reallocating channels from the conventional scan banks. Fixed and programmable step sizes. Relays clickey-clack while scanning across band boundaries. Triple conversion, First IF is 48.8, 778.7, or 266.7 MHz, depending on band. Second and third IFs are 10.7 and 0.455 MHz. Weak to moderate cellular images starting near 1106 MHz. Rugged construction. External power supply. DB25 RS232C connector. Audio peak filter. Ok scanning and great searching performance. See "ICOM R8500 Receiver," by Bob Parnass, in Monitoring Times, January 1997, for a review which includes quantitative test results.

UNIDEN/BEARCAT AND ELECTRA/BEARCAT

Bearcat III (Electra): 1976 vintage. 8 channel crystal controlled scanner. Requires optional front-end circuit board for VHF-low, VHF-high, and UHF bands, but only 2 boards can be installed within the radio at the same time. Two crystal filters. No aircraft band coverage nor rescan delay. Front mount speaker sounds good. Strong local oscillator radiation often causes interference with other scanners in the same house.

Bearcat IV (Electra): 8 channel crystal controlled scanner. Newer version of Bearcat III but contains front-end circuitry for VHF-low, VHF-high, and UHF bands. Better selectivity than Bearcat III or 12 due to having three instead of two 10.8 MHz IF filters. No aircraft band coverage. Front mount speaker sounds good. No rescan delay.

Bearcat 5 (Electra): 1979 vintage. Eight channel economy base model covering VHF-low, VHF-high, and UHF bands. 117 VAC only. No track tuning. Black plastic cabinet.

Bearcat 6 (Electra): Six channel VHF-low and VHF-high bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 8 (Electra): Eight channel VHF-low, VHF-high, and UHF bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 12 (Electra): 1979 vintage. One of the last decent crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic. Single conversion, 10.8 MHz IF. Selectivity is poorer than programmable models, like the 300, allowing adjacent channel

interference. Covers VHF-low, VHF-high, and UHF bands but no aircraft band coverage. Crystal positions must be arranged by band.

Bearcat 15 (Electra): 1983 vintage. Actually made for Electra by competitor GRE (General Research Electronics). The only Bearcat crystal controlled base/mobile scanner offering 118 - 136 MHz AM aircraft band. 10 channels.

BC101 (Electra): 1975 vintage. First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. DC operation requires optional mobile power supply.

BC100 (Electra): First programmable portable scanner. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC100XLT (Uniden): 1987 vintage. Very good 100 channel portable with 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no 800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack.

BC200XLT (Uniden): 1987 vintage. Also sold as BC205XLT through Scanner World. Very good 200 channel version of BC100XLT portable scanner but includes 800 MHz band. 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Decent leather-like case. Slide-on NiCd battery pack.

BC210 (Electra): 1979 vintage. First Bearcat scanner with a keyboard and numeric display. LED readout. See US patents 4,092,594, granted 5/30/78 and 4,114,103, granted 9/12/78 for further insight.

BC220 (Electra): 1979 vintage. 20 channels. Reasonable number of features but 20 channels doesn't seem enough. Service Search for Marine and Aircraft. See US patent 4,270,217, granted May 26, 1981. LED readout. Good scanner, but tinny audio.

BC220XLT (Uniden): 1995 vintage. Very good 200 portable scanner which is a smaller successor to the BC200XLT. Includes 800 MHz band. 10 priority channels. Service Search, including WX. Up to 10 frequencies can be locked out during conventional search, 20 frequencies from Service Search. Unique feature tells whether a given frequency has already been memorized. 10.8 MHz and 450 kHz IFs, with images 21.6 MHz away. 4 cell BP-120 internal NiCd battery pack. Marketed as BC230XLT with two BP-120 battery packs and CRX-120 dual charger. See "The BC220XLT/BC230XLT Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1996.

BC20/20 (Electra): 1981 vintage. Similar to BC220 but with 40 channels and different CPU circuitry. A maximum of 20 channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC230XLT (Uniden): See BC220XLT.

BC235XLT TrunkTracker(Uniden): 1997 vintage. Portable with 300 channels in 10 banks. Can scan or search in conventional or trunked domains but not at the same time. Scans Motorola Type I, II, IIa 800 MHz trunked systems, but only one trunked system at a time. Programming Type I and IIa systems requires knowing the Fleet Map ahead of time or else using exhaustive trial and error. A query feature identifies duplicate memory channels. Very fast scan and search rates. Scans 64 channels/sec and skips empty channels. Service search. Data skip. Triple conversion, 254.4, 10.85, 0.45 MHz IFs. Excellent image rejection and intermod immunity. Fairly good audio. See "The Uniden Bearcat BC235XLT," by Bob Parnass, AJ9S, in Monitoring Times, July 1997 or an on-line version at http://www.grove-ent.com for a review which includes quantitative test results.

BC250 (Electra): 1976 vintage. 50 channel model, rich in features, but lacks aircraft band and 144-146 MHz. Search and Store feature extremely useful for finding federal frequencies. Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage to surrounding components and circuit board. Failure of Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260 (Electra): 1983 vintage. Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen,

police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Good internal construction. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light panel to front circuit board. 9 volt regulator transistor Q28 (TIP29) may fail, causing blank display while leaving audio intact. Method of connecting an external speaker is awkward.

BC300 (Electra): 1979 vintage. 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of preprogrammed channels See US patent 4,270,217, granted May 26, 1981. Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100 components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite. See US patent 4,409,688, granted 11/11/83 for further insight.

BC350 (Electra): 1981 vintage. 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line, overpriced scanner but never very popular. Dual use keyboard and display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

BC760XLT (Uniden): Also sold as BC950XLT through Scanner World. Small, mobile scanner supplied with mounting bracket and wall wart AC power supply. Some of the keys are backlit. 100 channels in 5 banks. Service search. Earlier version has Motorola type antenna jack and AA battery backup. Later version has BNC antenna jack and internal lithium battery. Can be fitted with optional CTCSS decoder. Hyper sensitive and easily overloaded by strong signals, especially when used with outdoor antenna in base applications. Conventional 10.8 MHz IF prone to images. Television audio heard in some places.

BC800XLT (Uniden): 1985 vintage. 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives 10 meter fm and all of 6 meters, as well as federal portions of vhf and uhf bands. Fewer birdies on vhf-lo band than other scanners. Scans and searches very fast. Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor. Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner unplugged from AC outlet. Tunes in increments of 12.5 KHz on 800 MHz band, whereas cellular telephones are on 30 KHz channels. See "The Bearcat 800XLT ... an Owner's Report," by Bob Parnass, in Monitoring Times, March 1986.

BC860XLT (Uniden): 1995 vintage. 100 channel table top unit. Can lock out 10 channels during search. Good performer except for images. See "The Uniden Bearcat BC860XLT," by Bob Parnass, AJ9S, in Monitoring Times, May 1995.

BC890XLT (Uniden): Same as Radio Shack PRO-2036. Tuning knob. 200 channels, global delay. Count, AUX, and Auto Store features. Scans and searches fast. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IF -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

BC895XLT TrunkTracker(Uniden): 1997 vintage. Base with 300 channels in 10 banks. Covers military air band, but other frequency coverage is limited compared with the BC9000XLT. Predetermined AM and NFM modes not selectable. Can scan or search in conventional or trunked domains but not at the same time. Scans Motorola Type I, II, IIa 800 MHz trunked systems, but only one trunked system at a time. Programming Type I and IIa systems requires knowing the Fleet Map ahead of time or else using exhaustive trial and error. Weather alert siren. Built-in CTCSS decoder and tone finder. A query feature identifies duplicate memory channels. Test unit scans 85 channels/sec and skips empty channels. Triple conversion, 380.8 or 254.4, 10.85, and 0.45 MHz IFs. 800 MHz images in commercial and military air bands attenuated over 35 dB. For technical test results and a review, see "The Uniden Bearcat BC895XLT," by Bob Parnass, AJ9S, in Monitoring Times, December 1997.

BC9000XLT (Uniden): 1995 vintage. High quality base using up-conversion. 500 channels in twenty banks. Up to 250 channels can be programmed with alpha labels. Tuning knob.

Selectable AM, NFM, WFM modes. Optional CTCSS decoder. Very fast scan and search. Can lock out 50 channels during search. Delay and attenuator independently programmable for each channel. Effective Auto Store feature stores unique frequencies. Good RF section, but not as robust as PRO-2004/5/6. IFs are 380.7/254.4, 58.075, 0.455 MHz. One urban user, located within a couple of blocks of several high power transmitters, reports severe desense problems. For a full review, see "The Uniden Bearcat BC9000XLT," by Bob Parnass, AJ9S, in Monitoring Times, March 1995. For tips and modification information, see my column in June 1996 Monitoring Times. See US patents 4,947,456, granted 8/7/90, 5,163,161, granted 11/10/92 and 5,212,817, granted 5/18/93 for further insights into fast scanning and searching implementation.

BC2500XLT (Uniden): 400 channel portable with tuning knob. Plagued by intermod and images. Early units drained batteries quickly even while turned off.

BC3000XLT (Uniden): 1995 vintage. Excellent 400 channel portable with 20 banks. Up conversion. Very fast scan, search, and intelligent Auto Store. Mode, attenuator, and delay settings programmable for each channel. 50 frequencies can be locked out during search. Larger speaker than PRO-26 produces better, crisper audio. NiCd pack provides about 5 hours between charges. See "The Uniden Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, April 1995 and "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

REGENCY

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting two front ends via a capacitor). Not sensitive enough to cover the entire 30 - 50 MHz range in a single model. There three versions of VHF-low band coverage depending on the part of the 30 - 50 MHz band covered (LL, LM. and LH). TMR scanners use unsocketed incandescent bulbs for channel indicators which require periodic replacement. Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up at hamfests, often in poor condition. Don't pay more than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity. Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times. but power off/on restores sanity. Replace aging

capacitors in the scanning circuits. You can find a TMR8H eight channel high band unit most often.

TME series: The base versions of the TMR models. Both the TME and TMR models share many common circuits but the base versions contain speakers mounted on the front panel. The most common TME model is the TME8 H/LM eight channel dual band scanner in a metal cabinet with wood coloring.

ACTR series: Replaced the Regency TMR units. By the time Regency made the ACTR units, they no longer offered different models for different parts of the 30 - 50 MHz band. Look for the later ACT series, e.g., ACTR-106 (10 channel tri band) or ACTR20/6 (20 channel tri band), used light emitting diodes for channel indicators instead of incandescent bulbs. Available in 1 to 20 channel models - most are multi band receivers. Somewhat wide selectivity. Not all that bad a deal if cheap.

ACTE series: The base versions of the ACTR series. The ACTE and ACTR circuitry is similar, although the base versions contain speakers mounted on the front panel. The most common ACTE model is the ACTE8 H/L eight channel dual band scanner in a black metal cabinet.

WHAMO-10: Regency's first synthesized scanner. Appearance more like a crystal scanner, with a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. See US patent 4,057,760, granted 11/8/77. External frequency control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use. Not recommended due to maintenance difficulties.

K500: Nice wood-like cabinet. 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none. Built in clock when radio off or in manual mode. Can be programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlit keyboard good for night viewing and mobile use but generates RFI into nearby SW receivers. A favorite.

MX3000: 30 channel replacement for M400, but basic features only. Nice lit keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Good first scanner.

M100: 10 channel unit. Same as MX3000 except different color and fewer channels. Nicely lit keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

Z60: base/mobile sporting 60 channels, but 10 of them are for FM broadcast only. Built in alarm clock, priority, and memory which requires no battery backup. Covers 30 - 50, 88 -108, 118-136, 144-174, 440-512 MHz. Notice that it's not spec'd to cover some important federal bands: 136 - 144 and 406 - 440.

RCA

RP-6150: 1997 vintage. No frills, good performing portable. 200 channels in 10 banks. No military aircraft frequency coverage. Triple conversion and a flexible battery arrangement. Lacks duplicate channel detection, search skip, and empty channel lockout features of newer designs. Our sample isn't super sensitive at 470 - 512 MHz and has some intermod around the VHF railroad channels but is generally more resistant to image problems than the BC230XLT. For technical test results and a review, see "The RCA RP-6150 Portable," by Bob Parnass, AJ9S, in Monitoring

Times, April 1998.

RELM

HS200: 1996 vintage. Very good 200 channel portable. 10 banks. Built-in CTCSS and DCS decoder. Lighted keypad. Duplicate channel detection. 100 frequencies can be locked out from search. Very good audio and strong front end. Excellent internal shielding. Global rescan delay. Covers CB. Fixed modes and step sizes. IFs are 280.2 and 0.45 MHz, and perhaps one in between. See "The RELM HS-200 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1997, for a review which includes quantitative test results.

MS200: 1998 vintage. Made in USA. 200 channel mobile with alpha labels. CTCSS and DCS decoding squelch. Programmable via PC using supplied software. Low contrast, LCD display. Keypad backlit for night programming. Rear panel tape audio jack. Test unit had lots of intermod on VHF-high band. IFs are 280 and 0.45 MHz. See "The RELM MS-200 Scanner," by Bob Parnass, AJ9S, in Monitoring Times, March 1998, for a review which includes quantitative test results.

RADIO SHACK

PRO-24: 1983 vintage. Only 4 channels in this crystal controlled portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones. See "The Radio Shack PRO-24 Scanner," by Bob Parnass, excerpted in the "Technical Topics" column, RCMA Newsletter, February 1984.

PRO-26: 1995 vintage. (Not to be confused with a simple 1985 crystal controlled portable bearing the same model number.) Very good portable made by for Radio Shack by Uniden. 200 channels, very fast scan/search. Good display. Covers all TV channels, but spectrum adjacent to cellular phone band is censored which prevents monitoring parts of some trunked systems (e.g., IL State Police district 4). Up to 50 frequencies can be skipped during search. Limited image rejection causes 929 MHz paging interference in 170 MHz range. IFs are 380.7/254.4, 58.075, and 5.5/0.455 MHz. Audio suffers from small speaker. See "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

PRO-30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow control of SCAN, MANUAL, and PRIORITY functions while worn

on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other owners have had little or no trouble. Troubles included oscillation in IF stage, no UHF band reception, case broken around base of antenna connector, etc.

PRO-34: Portable scanner with 200 channels and 800 MHz coverage. Ten "monitor" channels. Operates from AA cells. Slow scanning, low audio output, and chintzy plastic case detract from an otherwise good performance. No decent leather case available from Radio Shack. If you need a portable with 800 MHz, get a Bearcat 200XLT. If you can't get a 200XLT, get a PRO-34.

PRO-43: Very good portable made by GRE. First Radio Shack portable with up conversion, and 222 MHz ham and 225 - 400 MHz military air band coverage. 200 channels, single search range. Small, convenient size. Muffled audio. Speakers in early units known to fail and more powerful speakers were used in later units. 800 MHz band coverage fully restorable in early units by removing diode. Uses same 6 cell battery tray as other high end GRE portables. Subject to interference in 160 - 162 MHz range. IF frequencies are specified at 608.005 - 611.2 MHz, 48.5 MHz, and 455 kHz.

PRO-52: 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills. Crisp squelch action and good audio, helped by a front mounted, vertical speaker.

PRO-60: 1995 vintage. Very good portable made by GRE. 200 channels, single search range. Similar features and same IFs as the PRO-43 it replaced but the PRO-60 has wider frequency coverage and crisper audio. Covers 75 MHz and commercial FM broadcast bands. Improved Direct search can be stepped manually in single steps. Uses same 6 cell battery tray as other high end GRE portables. Railfans take note -- the PRO-60 and PRO-43 are subject to interference in 160 - 162 MHz range. Draws 100 mA while scanning. See "The Radio Shack PRO-60 Portable," by Bob Parnass, AJ9S, in Monitoring Times, September 1995.

PRO-62: 1994 vintage. Good portable 200 channel scanner using up conversion. Similar to PRO-43 but no military air band, different upper frequency limit, and slightly different IFs. Selectable AM/NFM modes. Better intermod immunity than PRO-43. See "The Radio Shack PRO-62," by Bob Parnass, AJ9S, in Monitoring Times, February 1995.

PRO-64: 1997 vintage. Good portable 400 channel scanner using up conversion. Replaces PRO-62 and has many more features. Selectable AM/NFM modes but fixed step sizes. 10 search banks which can be cascaded. Auto store saves unique frequencies found during a search. Frequencies can be loaded using a computer but optional interface kit not yet available. Can recharge Radio Shack's optional, monolithic NiCd pack, but not AA cells within the scanner. IFs are 257.5, 21.4, and 0.455 MHz. See "The Radio Shack PRO-64," by Bob Parnass, AJ9S, in Monitoring Times, August 1997, for a review which includes quantitative test results.

PRO-67: 1997 vintage. Good portable 200 channel scanner using up conversion. Replaces PRO-51 and has better image rejection and super fast scanning. Service Search lacks police frequencies. Fixed AM/NFM modes and step sizes. Can lock out up to 20 frequencies during a search. Can recharge AA cells within the scanner. Frequencies adjacent to the cellular phone bands censored so our PRO-67 will not receive 868.9625 or 823.9625 MHz. Intermediate Frequencies are 254.4, 10.85, and 0.45 MHz. See "The Radio Shack PRO-67," by Bob Parnass, AJ9S, in Monitoring Times, October 1997, for a review which includes quantitative test results.

PRO-2001: Early, single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per channel. Mechanical lockout switch for each channel. Delay is either on or off for all channels at a time. High synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners have no trouble.

PRO-2003: Radio Shack's 1986 top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft. Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO-2003 hard to operate unless in a well lit room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to radiate signals into nearby receivers.

PRO-2004: 1986 vintage. Top of the line, wide band scanner for 1987. After a diode is cut, enjoy continuous coverage from 25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in 10 banks of 30, backed up by conventional 9 volt

alkaline battery. Any channel can be designated the priority channel. Scans and searches fast. Lots of well designed features, like 10 pairs of search limits, Lockout Review, default search increment and emission mode. Sound Squelch allows skipping dead carriers during search or scan. Metal cabinet, good internal construction and shielding, but no mobile mounting bracket or DC power cord. Soft touch membrane keyboard. Good sensitivity and selectivity. Very good radio. See "Product Review: The Radio Shack PRO-2004 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, February 1987, and Monitoring Times, March 1987.

PRO-2005: 1989 vintage. Essentially a size reduced PRO-2004 with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber keyboard, and vertical front panel make it easer to use mobile, although the keyboard is not backlit. More sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band. Highly recommended. See "Product Review: The Radio Shack PRO-2005 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, June 1989, and RCMA Journal, August 1989.

PRO-2006: 1990 vintage. Essentially the same as PRO-2005 but scans faster. Probably the best scanner made to date. Highly recommended. See "The Realistic PRO-2006," by Bob Parnass, AJ9S, in Monitoring Times, October 1990.

PRO-2021: Base/mobile scanner. 200 channels in 10 banks, LCD display and raised rubber keys. Lots of memory but scans too slowly and lacks 800 MHz. Ten "monitor" channels. Radio Shack seemed to have an overstock of 2021s as they were on sale for such a long time. Close out price dipped to about $200, which made it a nice scanner for beginners.

PRO-2022: Base/mobile scanner. Like the PRO-2021 but includes the 800 MHz band. Somewhat prone to intermod in the 460 MHz range. Cellular images throughout the 847.6 - 869 MHz range. See September 1996 Monitoring Times for modifications.

PRO-2035: 1995 vintage wide coverage base made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. Broader IF selectivity than PRO-2006. Poor dynamic range. 10 linkable search banks. Dumb Auto Store feature stores the same frequencies over and over. Wastes time scanning empty channels. See "The Radio Shack PRO-2035 - How Does It Compare With the PRO-2006?," by Bob Parnass, AJ9S, in Monitoring Times, January 1995.

PRO-2036: Same as Uniden/Bearcat BC890XLT. Tuning knob. 200 channels, global delay. Scans and searches fast. Count, AUX, and Auto Store features. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IFs -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

PRO-2037: 1994 vintage. Triple conversion all plastic base scanner made by GRE. Home version of the PRO-62 portable but with more intermod. 200 channels in 10 banks, one search bank, selectable AM and FM. Uses up conversion circuitry but inadequate front end filtering still allows images, though not as bad as in 10.7 or 10.8 MHz IF circuits. Crisp, respectable audio given the top mounted speaker. See "The Radio Shack PRO-2037," by Bob Parnass, in July 1995 Monitoring Times.

PRO-2040: late 1995 vintage 100 channel base made by Uniden. Fair performance, but minimal image rejection. Local oscillator harmonics account for spurious responses, e.g., reception of cellular telephone calls in the 460 MHz UHF-high band. Scans over 40 channels/sec. Can lock out up to 50 channels from search. "Soft" on/off power switching via keypad. See "The Radio Shack PRO-2040," by Bob Parnass, AJ9S, in Monitoring Times, December 1995.

PRO-2042: 1996 version of the wide coverage PRO-2035 base with improved firmware and amber display. Made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. NFM selectivity is still a problem but improved over PRO-2035. 10 linkable search banks. Smart Auto Store feature stores the unique frequencies. Can lock out up to 200 frequencies from search. Query facility indicates if and in what channel a frequency is programmed. Scan skips over empty channels automatically. Can sort memories by frequency within a given bank. IFs are 609 - 612, 58.05, and 10.7/0.455 MHz. Broader IF selectivity than PRO-2006. Overall, a top grade scanner and second only to Uniden/Bearcat BC9000XLT. See "The Radio Shack PRO-2042," by Bob Parnass, AJ9S, in Monitoring Times, February 1996.

PRO-2045: 1996 vintage. Very good 200 channel base/mobile made for Radio Shack by Uniden. Tuning/channel selector knob. 10 banks, selectable attenuator, and rescan delay. CTCSS-capable with optional board. Great Auto Store. Weather alert. Scans and searches fast. Can lock out 50 frequencies during search. Step sizes fixed but AM and NFM modes are selectable. IFs are 380.7, 10.7, and 0.455 MHz. Images on VHF-high band despite high 1st IF. Some intermod on review unit. See "The Radio Shack PRO-2045," by Bob

Parnass, AJ9S, in Monitoring Times, February 1997, for a review which includes quantitative test results.

PRO-2046: 1996 vintage 100 channel mobile made by Uniden with fairly good performance. Descendent of the BC760XLT but no CTCSS option available. Ten banks of ten channels. Scans memory at about 34 channels/sec. Service search, direct search, and band search. Preset search limits by band and user cannot program the search limits. Image rejection is minimal, as one would expect from a scanner with IFs of 10.85 and 0.450 MHz. 10 Monitor memory channels. Can lock out up to 20 channels from a search. See "The Radio Shack PRO-2046," by Bob Parnass, AJ9S, in Monitoring Times, October 1996, for a review which includes quantitative test results.

PRO-2050: 1998 vintage 300 channel Motorola trunk system tracking base made by Uniden. Tight front end. Excellent performance. Chassis-less, plastic construction. Squelch and volume knobs too close and Manual key is hard to find. IFs are 380.7 (approx.), 10.85, and 0.45 MHz. AM and NFM modes are factory set and not selectable. 300 channels in 10 banks and a 2 second rescan delay may be programmed on a per channel basis. Query feature identifies duplicate memory channels. Our PRO-2050 scans at 78 channels/sec., skipping over empty channels. 10 priority channels. Up to 50 frequencies may be locked out from limit search. A single pair of limits may be programmed for a limit search. No Direct key or direct search facility. Factory preprogrammed frequencies for police, fire/emergency, commercial air, public service, and weather, but not marine. See May 1998 Monitoring Times for a review which includes quantitative test results.

SONY

SC1PC: 1998 vintage. Good RF and audio performance. Covers 25 - 1300 MHz, minus cellular phone. Selectable step size and mode. Computer control and downloading with software and PC cable provided. Powered by ordinary AA batteries. Provided CDROM includes both the scanner control program and the multi million record PerCon FCC license database. 10 banks ("pages" in SONY parlance) of 30 channels each. Per-channel 2 second rescan delay. Unlike the ICOM IC-R10, you can scan any combination of memory banks. You can lock out ("skip") memory channels from scanning. The frequency stored in a skipped channel will also be skipped during searches. One priority channel checked every 5 seconds. SONY's limit search is restricted to one pair of search limits, though computer control expands this to 20 linkable pairs. Band search lets you search through 17 bands

programmed at the factory. Service search. A cache, termed Intelligent Memory, stores the last 10 unique frequencies that were active for longer than 5 seconds each. IFs (in MHz) are 600 (below 370 MHz), 232.5 (above 370 MHz), 45.0, and 0.455. See "The SONY SC1PC," by Bob Parnass, AJ9S, in Monitoring Times, August 1998, for a review which includes quantitative test results.

SPORTYS

JD-100: 1997 vintage. Limited 20 channel scanner which covers civil and military air bands only. Good audio. Large display shows frequency only out to 2 digits. Slow scanning and odd keystroke sequences. No key press confirmation beep. Cannot lock out channels from memory scan. Powered by AA batteries. Battery saver circuit. See "Sportys JD-100 Air Scan," by Bob Parnass, AJ9S, in Monitoring Times, November 1997.

CRAIG (division of PIONEER)

4530: Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you find one in good condition.

SONAR

Sonar made several crystal controlled scanners and channelized monitor receivers which shared the same RF circuitry. Each radio was housed in the same size metal case and worked on both 120 VAC and 12 VDC. The models differed in the number of channels, the band coverage, and whether individual channels could be locked out.

Although they used a 10.7 MHz first IF, Sonar radios require parallel resonant crystals different from the common series resonant crystals used in Regency and Radio Shack scanners. Some Radio Shack crystals will work in Sonar units, but more often they oscillate a few kHz off frequency and are unsuitable unless changes are made to the oscillator circuitry. Therefore, beginners should avoid these radios. Typical Sonar squelch has long time constant causing a long noise burst at the end of each transmission.

FR-104, FR-105: 6 channel monitor receivers covering 25 - 50 MHz or 150 - 175 MHz. Manual channel selection, i.e., no scanning. Early models are identified by an 11 pin connector on the rear and they could be used with an

optional NiCd battery pack and charger which bolted to the rear panel. Later models used Cinch Jones connectors with flat contacts. Optional tone decoder board.

FR-2512, FR-2513: 24 channel versions of the FR-104 and FR-105 monitor receivers. Manual channel selection, i.e., no scanning.

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority. Recommend you avoid these models as there is no way to lockout a channel from the scan sequence.

FR-2526, FR-2526, FR-2528: 10 channel scanners covering various combinations of 3 bands. Each channel could be locked out. Channel 1 priority.

Table 1. Summary of Sonar base/mobile monitor and scanner receivers

TENNELEC

Manufactured the first synthesized scanners. See US patents 3,961,261 and 3,962,644, granted 6/1/76 and 6/8/76 respectively. Company went out of business several years ago. Schematics and parts difficult to obtain. Radios reputed to be poor performers. Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit diagrams.

Plectron and Motorola Alert Monitor Receivers

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola Alert monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough

condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola Alert crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. These radios are fixed channel units and do not scan. They can be powered form 117VAC or 12VDC with the proper mobile cord.

The audio quality on a Plectron P1 or 700 series is far better than any consumer grade scanner and the sensitivity and intermod immunity is outstanding if aligned properly. Better image rejection than most scanners (see article by Bob Parnass in Monitoring Times, January 1996 for comparison). The Plectron 500 series is less desirable. The Motorola Alert monitors are pretty good, although the audio lacks bass.

No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, and there were versions optimized for each portion of the band. There were different "split" models to cover segments of VHF-hi band, too. Although UHF versions were made, they are somewhat rare.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency. Too, the P1 and R700 require different crystals.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Repair service for the Plectron P1 and R700 models is offered by:

Woodson Electronics
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal Signal in University Park, IL, phone (800)524-3021. For more information, see "Add a Crystal Receiver to Your Arsenal," by Bob Parnass, January 1996 Monitoring Times.

Custom Color Map & Report
of Transmitter Sites Near You

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $4.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard

or $34.95 for deluxe RadioMap report with histogram.
Include your name, address, and telephone number, along with
center location (nearest intersection of 2 streets, or
latitude & longitude) and mail to: Bob Parnass, 2350 Douglas
Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central
time. For a brochure, send SASE.

How to Obtain Copies of Patents

Printed copies of US patents may be purchased for $3 each,
but you must know the patent number. Credit card orders are
taken over the telephone by the Assistant Commissioner for
Patents at (703)305-4350. Alternatively, you can mail a
check or money order, made payable to "The Assistant
Commissioner for Patents" to

The Assistant Commissioner for Patents
Washington, DC 20231

For more information about the US Patent and Trademark
Office, call their automated information message system
toll-free at (800)786-9199.

There are various patent servers on the world wide web,
including IBM's server:

HAMFEST/COMPUTERFEST CALENDAR 1998 - NORTHERN ILLINOIS
last updated October 30, 1998

o Please report additions or changes to Bob Parnass, AJ9S, office phone: (630)979-5414, electronic mail: parnass@bell-labs.com. Thanks to Dennis Dale, Rick D. Wilson, Tom Harker, and ARRL for providing some of the information.

DECEMBER 1998

Dec 19 (Sat), Grayslake, IL. Computer Country Expo (see details below). Lake County Fairgrouds.

JANUARY 1999

Jan 24 (Sun) - Villa Park, IL - Wheaton Community Radio * Amateurs Mid Winter Hamfest - '98 at the Odeum Exposition Center 1033 N. Villa Ave., Villa Park, IL. Info: Pat Byrne, * K9JAU, 414 North Park Blvd., Glen Ellyn, IL 60137. 630-545-9950. E-mail: k9jau@juno.com, http://www.w9ccu.org (Held inside and is usually crowded. - AJ9S)

COMPUTER SHOW NOTES

Computer Central computer shows are held at the College of DuPage, Main Arena of the Physical Education Building Park Blvd & College Road, Glen Ellyn, Il. 847-940-7547. $5 admission with card, normal admission $6.00. Opens 9:30 am - 3:00 pm. See http://www.computercentralshows.com web site.

Giant Computer shows are usually held at the Orland Park Civic Center, 147th St. & LaGrange Rd., Orland Park, IL or at the DuPage County Fairgrounds, County Farm & Manchester Rds., Wheaton, IL. Admission is $6. Show hours are 9:30 AM - 3 PM. To get on the mailing list or get more information, call (847)974-3123. See http://www.giantcomputershow.com

Computer Country Expo is Lake County's largest computer expo. The event is held on designated Saturdays from 9:30 AM to 3:00 PM. This show features computers, supplies, games, parts, software, accessories, CD-ROM, monitors, diskettes, printers, keyboards, modems, disk drives, cables, expansion boards, services, and anything else in the domain

of computers! Lake County Fairgrounds, Route 120 (Belvidere Rd.) & Route 45, in Main Exhibit Hall Building #1=9720,000 sq. feet of everything Computer! For a show map, exhibitor info, and discount coupon, visit the web site at http://www.ccxpo.com.

my 800xlt went south so I sent it in to Uniden for like $50 or $75
they fixed it. It was the 800 mhz circuit that went bad.

Can anyone point me to a review of the RS Pro-2066 mobile scanner? Any first-hand experiences, pros/cons appreciated.

Other recommendations for a mobile (auto/truck) scanner welcome. Full coverage (as full coverage goes these days) required. Trunk Tracking capable preferred.

Also, any thoughts on a mobile scanner antenna? Preferably one that does not require any hole drilling. How are the through-the-glass types?

Thanks in advance.

Perhaps that is a requirement in Canada. The U.S. hams are bound by Part 97
of
the FCC rules and regulations. I see no reference nor requirement to obtain
and follow any ITU "list".

In a manner of speaking you can. In a contempt of court issue. For example, after a judgement is issued, if a defendent is required to provide certain information to a plantiff (interogortories) such as salary info, bank accounts, location of property, ect; and the defendant fails to, the judge can have him locked up until they comply. This has and does occur.

By the way, (BTW), here is the precise excerpt from the U.S. FCC rules and regulations:

Permissible countries: Section 97.111 of the Commission's Rules, 47 C.F.R. §97.111, authorizes an amateur station licensed by the FCC to exchange messages
with amateur stations located in other countries, except with those in any country whose administration has given notice that it objects to such radiocommunications. Currently, there are no banned countries.

A HUGE difference. You will pick up things you never heard before due to the significant increase in sensitivity. Also your intermod distortion will decrease. You will be able to pick up USB and LSB and the audio will be better. What else could you ask for . BUY IT!

Mint PRO-2042 (and I mean mint) in the box. Like new, with RS Discone antenna (the $59.99 one, or was that much) and enough cable to get it about 10ft up. I know this will bring the mighty morphin price protectors out, but asking $269.00 for all (hey, I paid $299 for just the 2042). I want to buy a new Welz WS2000 and that's the list price on them. If you've got a Welz (or the diamond equivalent) I'll be happy to talk as long as it's in mint condition. Also will consider trades for a MVT-7100 and of course an Opto Scout, an Icom R-10 or (hehe) an AR8000 or AR8200. Anyway, want to get the WS2000 quick so talk to me, we can probably work something out....

I stated that "I would bet" - not a confirmed report that CBers are also QRMers. It is just my feeling and I've seen that it's pretty much the trend. Bad CBers (I've heard a few) become lids on amateur airwaves - FCC licensed or not.

Mine does the same thing. However, it only does it when it's hot. If I take the radio out of the case, it runs fine. Tried touching up all of the solder joints, to no avail.

Can you point out some places where I can probe with a scope or a VOM? I have a copy of the service manual but am not sure where to start

I know that this radio has huge problems with bad board feed throughs and solder joints.

Chris

> What is so much fun about a radio service that has so many restrictions.
> Freedom is the way to co about it as long as you do not step on someone
> else's rights

Restrictions that only improve on the quality of an amateur. People yell, curse, insult, and demean others over the phone and CB. Normally, this is not performed in the amateur radio service. Lids might, but the majority "of us" don't. At least I don't, and nobody on the local repeater does, either.

Does not the law grant everyone freedom of speech - but, more importantly, proclaim that every man is equal?

Please punctuate.

> Oh please. Yes, in theory it can. But the majority of people won't.

Good. Then encryption isn't required.

> Hmmm. Although there are a few hamsats that you can use with just the
> duck on the hanheld, most cannot, and require an antenna that you
> cannot reasonably handhold.

I didn't say "duck". I said "helical antenna" which can be small yet powerful, but connected to the radio via coax, not directly.

> You are getting your terms confused Ryan. Which autopatch will let
> you know who is calling you?

Reverse autopatch with caller ID is a simple concept. As long as the modem at the repeater site can decode caller ID, and the repeater has a dynamic voice that can speak the names and numbers and who the calling party is calling, you have a reverse autopatch with caller ID.

> Not for true hanheld use.

Didn't say "handheld" here.

> 'The point is, that it is a dual use phone. Two methods of
> communication. All the sats go down, there is still use in many
> areas of the world.

PCS in Siberia?

> Iridium does it with less power.

If Iridium can with less power, than certainly a radio can match that.

> So can my Email, with a translation program, on an Iridium phone.

A translation program in a phone... <chuckle>

> Think again. If you are useing sats, HAMSAT will go down when those
> sats go down.

Didn't say I was going through a satellite. I should've been more clear. When satellites and their phones are dead, amateur radio is still alive.

> If you are using an autopatch, the patch will go down when the
> telephone system goes down.

And the satellites which require connections to/from the calling party will go down also.

> All in all, the Cellular towers seem quite a bit more reliable than
> many HAM repeaters.

How?

> And hope someone is listening, or there won't be so much QRM that you
> cannot get through. Meanwhile that person with the Iridium phone

They both receive the 800 MHz band without the need of modifying it.

6328. Scanning speed and sensitivity mod for Alinco DJ-X10 ???

Newsgroup: rec.radio.scanner
Date: 1998-11-29 00:00:00 UTC
From: Rune Austefjord <xrun@c2i.net>
Message-ID: <73qi3n$p4o$1@romeo.dax.net>
Source record: 136624
Cross-posted to: alt.radio.scanner,alt.radio.scanner.uk,dk.teknik.radio.scanner,rec.radio.scanner

Are there any modifications available for the Alinco DJ-X10 scanner to increase the scanning speed ?

Are there any modifications available for the Alinco DJ-X10 scanner to increase the sensitivity on the bands where it has really a piss poor sensitivity ?

Please reply to xrun@c2i.net

6329. FS: (Scanner) AOR 1000 XLT with manual, case, and cpu reset / mem. clear instructions.

Source record: 136625

FS:

AOR Scanner 1000 XLT
Case
Official reprinted manual (excellent quality)
hard to find CPU and Memory clearing reset instructions
Jumper included for cpu reset/memory clearing

Radio has always been kept in case, almost mint condition, case is
slightly worn, no scratches on face, original rubber duck bnc antenna.
Handles .5 - 1300 mhz receive. (Celluar is NOT blocked!)
20 channel per second scan.
Original DC charger.

Not included:
No rechargable batteries, but can run off included power supply, takes
4 AA batteries.

Take all for $300.00 US Money Order

This radio is most "i think" sought out for it's celluar recieve by
what I have been told.

Send E-mail via kf4tuz@qsl.net for more info.

I've written a Windows program which allows you to monitor MDT traffic on systems that use Motorola's MDC-4800 protocol by plugging the discriminator output of your scanner into the microphone/line-in input of your soundcard.

The program (and source code) are available at http://www.geocities.com/ResearchTriangle/Facility/7646/

Features:

- Uses the sound card to acquire the data to decode, doesn't require the use of a data slicer. Just plug the discriminator output of your scanner into the microphone/line-in input of your sound card and away you go.

- An "MDT" window displays received MDT traffic the same way it appears on the terminal to which it was sent.

- A "Terminals" window lists all of the terminals to which data has been sent since the program was started. You can select a terminal from this list to see the last 30 messages sent to that terminal.

- A "Messages" window displays summary information of only the traffic you want to see, configurable via rules you setup.

- The raw ASCII MDT data which the program is interpreting can be viewed in a seperate window and also captured to disk.

- A machine running MDT Monitor with a scanner can act as a server to other machines running MDT Monitor which don't have scanners connected to them. The MDT data received by the machine with the scanner is sent to all of it's MDT Monitor clients.

Source record: 136628

That's going to simplify troubleshooting in your case. Leave the
radio on (in the case) to allow it to heat up to the point where you
are having problems. An aerosol duster (available at camera shops
and electronics supply centers) when inverted, shoots liquid freon
(not R12). Being careful to only hit a few areas at a time, spray
an area, wait a minute or two, spray another area. When the problem
goes away, you've found the location of the problem. We had a
problem with an ECG monitor that would only fail when outside. Using
this technique, I was able to find a cracked solder joint on a capacitor.

Russell,

Most mods for Radio Shack scanners can be found online at this link:

http://w5gb.nmsu.edu/kc5kto/mods.html

Unfortunetly, with only 10 channels, your scanner was passed over
for more capable ones. Not to say it can't be modified, just that nothing
at this popular website was published for it. I wouldn't even suggest adding
a PROgramit interface, which can be added to any scanner. Hardly
worth having your computer enter in only 10 channels! Use this scanner
to monitor 10 of your favorite channels and buy another used one with
a little more capability. The link above makes for a great shopping list.
I take a copy when looking for used ones. You can tell the capabilities
at a glance.

Remember, no ONE scanner does everything well. That's why so many
of us have multiple scanners. My first one was a Regency Z-45 (still have
it). I'm up to five and still looking...

Figure out the freq. that is active in your area and look at a chart with
the cell site number with it. Then look at the cell site # on the chart and
it will give you the freq. for that cell area.

I can't speak for anyone else, but I certainly have not interest in doing this. It would surprise me greatly if there were more than a dozen people interested in doing so.

My guess is that it should be available as an option or "extra" to the program that those who were really interested might pay a premium for this feature.

You might consider expending your energies on making your program better looking, easier to use (whatever). I've been looking at software for my AOR5000 and all of them are pretty grim...including yours.

In the USA, cell tel frequencies are 869-896 and 920-950mhz
the data channel is a buzzing sound. most transmissions are clear analog
but some are digital.

PCS phones, I think use frequencies in the 1900mhz area

Hi,
I'd be interested.. I've been thinking about sacrificing a scanner for this purpose (sacrifice an FM radio first), but having it controlled by DTMF tones (through a PC) over the phone instead. Kinda weird, but I'm not trying to increase my audience.

Check out the US customs web site on products and quantity you can bring
into the US. I would bet there are restrictions.

Wrong Newsgroup. For the most part...we talk
about "RADIO" scanners. Try this NG:

comp.periphs.scanners

They can help you there,

Newsgroup: rec.radio.scanner
Date: 1998-11-30 00:00:00 UTC
From: Robert <rc123@globe-net.net>
Message-ID: <366360F0.9BBB853C@globe-net.net>
Source record: 136254

For a few dollars more (literally), you can get the
BC895XLT, which has a computer interface built-in.

Rich Wells has an excellent website and he has
reviewed many radios, including the 895. To view his
comments, visit this link:

http://www.strongsignals.net/htm/bc895.htm

CEI is advertising the BC895XLT for $194.95. HOWEVER,
they have very high handling and shipping fees. These
need to be considered when purchasing from this company,
or so I am told. You can find them at:

http://www.usascan.com/

Though I already have 5 scanners, I am still considering this
model. I'll probably wait for an EDACS version of this radio.

Good luck with your purchase.

Radio Shack makes a 4-way splitter amplifier that says it will work between 50-400 Mhz. I am currently using it to split cable TV around my house, but with adapters it should work with a scanner within those freqs.

Hi guy's;

It's been done. Check out the URL. The scanner is located somewhere
outside Washington DC.

If you do it I would suggest that the listner controlling the receiver
be allowed some period of time, say 2-5 minutes.

A very good review of the new WR-1500e has been published in last two
issues of Monitoring Times.

I have this unit and it's excellent. I also have the Digital Suite and
have been regularly receiving ACARS and Wefax with good results.
The spectrum analyzer is a beauty.

Hope this helps,
Chris

:
:Which is more sensitive particular in the vhf lo range? the first one or the
:last one?
:It seems that sensitivity is by mode (i.e. nfm, wfm, am) but does a higher
:number mean more or less?

The number is how many microvolts is needed at the antenna socket to
achieve a certain signal to noise ratio. Generaly the lower the number
the better although you need to know what SN ratio is being used.
SN ratio is the ratio of wanted signal to the noise generated by the
scanner.

:And whats the difference between uV and micro.

uV means microvolt. Micro is just a prefix meaning millionth.

:The two scanner specs listed are for the RS pro 2006 and pro 26 models.
:I'm just trying to understand the dB (decibel?) uV (?) and micro(?)
:terms and how they apply to the sensitivity.

Deci meams tenth so a decibel is a tenth of a bell. dB is used to express
a ratio. 3dB is 1 to 2.

:Scanner # 2
:Sensitivity (20 dB S/N with 60% modulation for AM; 3 kHz deviation for
:NFM;
:30 dB S/N with 22.5 kHz deviation for WFM)
:
: NFM 40.84 MHz.....0.5 (Micro)
: S+N/N=20dB 162.4 MHz.....0.6 (Micro)
: 453.25 MHz.....0.6 (Micro)
: 954.9125 MHz.....0.8 (Micro)
: 1299.9125 MHz.....1.0 (Micro)
: WFM 62.45 MHz.....5.0 (Micro)

: S+N/N=30dB 195.5 MHz.....5.0 (Micro)
: 531.5 MHz.....5.0 (Micro)
: 765.25 MHz.....5.0 (Micro)
: AM 25.5 MHz.....1.3 (Micro)
: S+N/N=20dB 108.5 MHz.....1.5 (Micro)
: 127.175 MHz.....1.5 (Micro)
: 230.05 MHz.....1.5 (Micro)
: 325.05 MHz.....2.0 (Micro)

S+N/N means (signal plus noise) to noise. It's like SN except that it
takes into account noise picked up by antenna.

I recently purchased a radio from a ham that was severely misrepresented. I got it VIA USPS COD. The guy is in the ham call book. Does anyone have any experience with this type of fraud? A technician said it would cost about $200 to fix the Kenwood TS440S. So far he hasn't answered my emails concerning this matter. What are my options legally? I don't want to identify him yet until I see whether he makes it good or not. Tnx! Bill K9KZ

I am trying to find some software to decode the signals from short wave around the 2-5Mhz range. Poeple have said HamComm, but I need one that will use the sound card. I have built the interface but don't seem to get any joy and I have no idea how to test it to see if it works. I am not just trying to decode the ham signals i.e rtty cw etc but the general signals found in this band.

Any help would be much appreciated.

Thanks.
Ben, London

Hi,

With Radio Manager for Windows controlling the BC895XLT, you can display descriptions for talkgroup IDs on your computer screen along with the ID. Radio Manager also features a Size Code Helper for determining the correct size code for Type I systems. There are many other features, like uploading & downloading both frequencies and talkgroups, so you can quickly switch profiles, even if you don't run the radio on computer control most of the time, this is a big advantage to a computer controllable scanner.

Please visit http://www.interplaza.com/bensware/rm.htm for more details and to try Radio Manager for Windows. In the help file are instructions for making your own interface cable.

Happy Scanning,
Ben Saladino, KC5IRJ

In listening to people discuss the code requirement over the years,
I have come to realize its not that people don't want to learn the code, its
that some can't. I myself find that although I can pass the test I just can't
become comfortable enough with it to truly master it. That is to the point
where I can increase my speed or hold conversations with it.

So I would like to see a system where if a person can't pass the
test but can demostrate a good faith effort to learn the code, we waive
the requirement. If they tried, it should be good enough.

Hi Paul

I think IF you have a serious cber as I was in the 70/80s before the Fm
regime came in, I spent more on filters etc than I did on my rig, I
lived in a very built up area in the UK and it was essential to transmit
a CLEAN signal, boy did we curse the Italians in those days with their
bloody great burners bleeding over evertything.

If I were to go back into CB now I would be quite willing to go to those
extremes again, there is nothing more annoying than somebody txing and
it come over tv telephone radio etc
regards
Paul

> force????

I'm gonna regret getting into this...

I think Paul's point was that hams are required to know these sorts of things to pass the tests to get a license. (So the theory goes, pun intended. The tests, unfortunately, can be passed by memorization of the question pool.) A CBer can, on the other hand, walk into RS, drop $100 or less, and be out the door without knowing the what or the why of how it all works.

For example, while investigating interference complaints, a ham should be able to see the significance of a rusty screw holding a couple of pieces of sheet metal together.

That is emphatically NOT to say that all CBers are ignorant and/or stupid. Rather, it is to say that no one forces a CBer to learn anything about RF safety, basic electronics theory, etc, etc. Personally, I've no patience with the radio "bigots" of any kind -- CB or ham.

6391. BC895XLT Computer Interface Question

Newsgroup: rec.radio.scanner
Date: 1998-11-30 00:00:00 UTC
From: jmcsorley@usa.net
Message-ID: <73ut4eoms1@nnrp1.dejanews.com>
Source record: 136358

Can the computer interface be used to (theoretically) control a fast RF switch connected to an antenna bank? For example: Say a signal on 4XX.XX MHz breaks the squelch using a default multiband antenna. The PC detects that it is a UHF frequency, and takes action (via the RS-232 or some other interface) by generating the control signals to make the switch change to the UHF antenna. Or, say your desired signal is from a distant town and you have a dedicated directional antenna for that particular frequency.

Another way to do this would be to cahnge the antennae during the actual scanning....50 ch/s equates to 20 ms, which is plenty of time for PIN diode switches (especially ones that do not have to handle transmit power).

Silly or not?

John McSorley

Hoo hoo hoo, who told you THAT whopper?! This person is nowhere near "in the know" because I have asked about such a system in existance only to get a "boy - I wish!" response from the cop. I've seen their MDT's in action, and they don't display any pictures - sorry. Motorola just released a new unit recently that WILL do it, but since Phoenix is still a bit bent over having to pay $10,000 per radio car for the systems they have now, I wouldn't expect to see one of these anytime soon.

>I have moved from Phoenix to Sioux Falls, SD, to work for a large

Hi All,

I'm playing around with adding internet control to Radio Manager mini 32 for Windows 95, and could use some input.

First and foremost, is there any interest in being able or allowing others to control your scanner over the internet?

It would be up to you to provide a means of delivering the audio from the scanner. I haven't had any experience with any of the "live audio" servers, but suspect they might come in handy. I am aware that rebroadcasting some signals would be illegal, and don't want to get into the audio delivering aspect of it for that and other reasons.

Other than hobby use, does anyone else have a need for this? If so, please tell me more about how you might use such a program.

For more information on Radio Manager mini 32 for Windows 95, please visit http://www.interplaza.com/bensware/rmm32.htm

Happy Scanning

Amateur Radio Service Communications

Answers to Frequently Asked Questions

The following are answers to frequently asked questions about communications appropriate for the amateur service. See Part 97 of the Commission's Rules, 47 C.F.R. Part 97, ("rules") for the complete regulations.

COMMUNICATIONS

Q. Can I operate my station as soon as I see that information about my amateur operator/primary station license grant appears on the amateur service data base?

A. Yes. You have authority to operate when the information about your license grant appears on the data base.

Q. Does this mean that I don't have to wait until the license document arrives in the mail?

A. That is correct. You do not have to have the license document in your possession in order to operate.
This is from the FCC's web page on FAQ's found here
http://www.fcc.gov/wtb/amateur/amfaq.html

6411. 4 scanners / 1 antenna?? Help!!

Newsgroup: rec.radio.scanner
Date: 1998-11-30 00:00:00 UTC
From: dave@boatanchors.com
Message-ID: <73v5f3$1v$1@nnrp1.dejanews.com>
Source record: 136378

Hello all,

I am working on a project for an office where there
are 4 Bearcat BC9000 scanners and they would like
to connect to a single discone antenna on the roof
of the high-rise office.

Is there a product anyone is aware of along the lines
of a broadband distribution amplifier or active antenna
splitter that could be used for this purpose? This is
a government project, so we have to use a 'commercially
available' solution rather than any do-it-yourself method.

Even if you don't know an exact model, if you know of
someone who makes such a beast, please drop me a line.

Many thanks,

dave@boatanchors.com

Who uses ham radio for rescue situations? Well, in the past year, the
state of Texas DPS (State police), City of Austin/Travis county Texas
Emergency Management Office, the Austin/San Antonio National Weather
service office, the American Red Cross. That's just some of the users
I've personally been involved with this calendar year. I know of
quite a few other users.

In many emergencies, hams are the only ones with reliable
communications. Cell phone systems get jammed in emergencies. Fancy
public service radio systems fail. 911 systems go out. I've personally
seen ham radio used in all 3 of these scenarios.

>antenna for that particular frequency.

Shouldn't be a problem.. The only trick would be to find/build the switch itself since it has to accept commands from the computer. I don't know how to build one or if one already exists, but if I had such a thing it'd be easy to check the freq being received and then fire off a command to the switch.

Reason its illegal is becouse its considered Conversating with the enemy.
If inforced you could be thrown out of the country or inprisoned for treason
if the GOV could prove that you were passing out Info that could be
detrimental to the security of the country.
Its Whole National Security thing.Dont think some scrub at the NSA does not
have machines listening to Freqs.Once you think there not listening
then you screwed up.Boy would a few of you be suprised at the
technology our government holds.
Encription is the battlefront of the TEchnology age.Out Government does
not want use to have it.They want to beable to pry into your life.128 bit
encryption can be easily broken with NSA Mainframes.128 bit would
be what Netscape and Explorer use.PGP is getting old but with 1024 bit
encryption dont think if the Gov broke the code they would tell anyone.
There is a new Encryption Program that the government is jumping up
and down about.There are super pissed about it.Owell I guess Illget
back in my corner since my favorite mudduck in Texas said I dont
know shit.No lady one shot Ill never let you forget you called out the
wrong person.Im a prick like that.

Where should I look for frequency info? I just got a scout and it keeps tagging 163.250. On the scanner it even receives it with the antenna off so I know it's close. Is there a website, FCC maybe, that has info on that frequency?

This is a very common Pager frequency for Doctors.

It's very strong here in the San Jose Area.

>(b) EXCEPTION FOR ACCESS FOR LAW ENFORCEMENT PURPOSES-
>Subsection (a) shall not affect the authority of any investigative or law
>enforcement officer, acting under any law in effect on the effective date
>of this chapter, to gain access to encrypted information.

This negates the whole thing. If a law enforcement officer wants
access, they can get it. The Constitution also gives you protection
against unreasonable search and seizure, but police departments across
the country conduct some 50,000 seizures a year, 80% of which are
never prosecuted (never mind *convicted*) yet the property is not
returned. They get away with it by saying that PROPERTY has no
rights, even when it's yours and you have committed no crime.

Your computer has no rights and they can pull the same sort of
immoral, unethical, unconstitutional crap. And they WILL DO IT.

Since MOST interference complaints aren't related
to mobile operation, but rather from base stations,
then the license is probably readily available anyway.
Additionally, just make a photocopy of your license
and keep it in your wallet if you think it would be needed.

>Plus a copy of whatever ordinance might apply with the
>exclusions highlighted. This thing has the potential for driving street cops
>nuts. How the heck is a street cop ever gonna tell if a CBer is running 4w or

Exactly the point! Again, the problem is usually NOT
related to mobile operation anyway.

Cheers,
Bill K2UNK

Yes, you can look up frequencies at the FCC Website at:

http://gullfoss.fcc.gov:8080/cgi-bin/ws.exe/beta/genmen/index.hts

The frequency that you're referring to is a common pager frequency
for most Hospitals and Medical Centers across the country.

For those that are interested, we have set up an incident paging system for the Southern California area called SoCal News Page. The system is set up similar to fire page services but covers police and rescue incidents as well. System, TTID, and frequency information are part of the page so you can tune in and hear the incident as it's happening. There is a minimal fee for participation in the service ($6.00/month) which goes to pay for paging service and software for some of our dispatchers, but we are looking for dispatchers who will send a certain number of pages per week. Dispatchers get free News Page service, and some may qualify for free alpha-paging services. If you have an alpha-pager, and would like to participate, go to http://www.SoCal911.com and check out the section labeled SoCal News Page.

Source record: 136406

As of September, when I moved, I could recieve at least one Phoenix PD MDT channel. It was not Glendale or others, but Phoenix. A little text, with a lot of garbled characters. I asked a person "in-the-know" about this and he stated that the large chuck of garbled characters is actually a PICTURE of the driver (or suspect) being transmitted. Ok, who's gonna write the code to display the picture?

I have moved from Phoenix to Sioux Falls, SD, to work for a large computer manufacturing firm that ships its products in large cow-spotted boxes.

Glad to say that the Sioux Falls PD has MDT's in their cars and are much more informal about what they post over the air than Phoenix. :)

Source record: 136410

If NYC goes to a trunked system like the motorola trunked system I listen to in Norhtern Ca., there would be a problem with even a 2 second delay. When a unit finishes transmitting, the repeater keeps the frequency open for about 1 second before releasing the frequency (thus allowing the trunking to lock on another frequency upon the next transmission).

They haven't released it yet! :)
String you along for the $459 price and they say the price will go up to $549 after it is released.
In September they said " a couple of weeks". In October they said " a couple of weeks". By Mid-October they said at the end of the month. In November they said "almost". By Mid-Novemeber they
said "by the end of the month". Now it is the end of the month of November so ... When?

The Euro version is out so they say here is the address (snail mail) in Germany

Telcom-Munications
Dr Alfred Herrhausen Alle 54
D-47228 Dusiburg

Tel: 02065 77220
Fax: 02065 772 277

Good luck as I havent made up my mind if I should pay now or later. The ScanStar software for it
won't be released until the OPTOCOM is.

Hi Pixter, it takes a long time before you decide!
I seem to remember you are wandering around now
here for quite a few weeks, again and again asking
on Yupi-7100 and others. J U S T B U Y I T.

There is no comparison between a Yupiteru MVT-7100
and a BC-200XLT, as there is also no comparison
between a Chevrolet and a Beetle.

By the way, to prevent you from missing the clue, the
Yupi is NOT a Beetle ...

It has been my favourite scanner over the years, in
which I also had numerous Bearcats (including 200XLT),
Icoms, AORs and (please forgive me) a Realistic ...

6450. Re: New CHP Frequencies?

Newsgroup: rec.radio.scanner
Date: 1998-11-30 00:00:00 UTC
From: Mike Derryberry <michael.derryberry@cwix.com>
Message-ID: <36626F8B.54EB1614@cwix.com>
Source record: 136421
Cross-posted to: alt.radio.scanner,rec.radio.scanner

I do know from my listening that San Luis Obispo Dispatch (White 42.72/42.56) uses a repeater, Indio Dispatch (Red 42.28/42.44) uses a repeater, San Diego (Border Dispatch numerous 39mhz freqs) uses repeaters.

From what I am hearing many parts of the state are going to repeaters, but only parts of Southern California are going to 39mhz repeaters, the rest of the state is using 42mhz repeaters.

6453. FS: Pro-43 ...$50 ...

Newsgroup: rec.radio.scanner
Date: 1998-11-30 00:00:00 UTC
From: kaliber@pacbell.net
Message-ID: <36627d61.3138676@news.pacbell.net>
Source record: 136424

I have a Radio Shack Pro-43 handheld scanner ......worked fine
...put it away for a couple of months and now not receiving any
stations. This scanner appears to be working fine. Display , keypad,
squelch ..and volume all seems ok ..it just doesn't ever find any
stations. This scanner usually sells for $225 in working condition ,
you take it in and get it fixed and its your gain. I have never had it
looked at yet and don't plan on it any time soon. I will trade this
NON WORKING scanner (looks like its working though) ..for
an antenna tuner (one with swr and power meter) or a keyer/
paddle combo ...or sell for $50 cash plus about $6 shipping.
(3 day and insurance) This scanner has a rubber duckie antenna
and manual with it also. (regular alkaline batteries).
This is a legit offer ...I think that this would likely be a good
deal for some young hobbiest looking to save a few bucks.
If I'm off base on this please don't hack me to death ..but
feel free to e-mail me and tell me so. I have been in the
Amateurs Callbook for 38 consecutive years ....(check
me on QRZ.com too ...!

Thanks in advance ...
Dusty

people,people,people
and oh ya that asshole who calls himself cb rambo;
How quickly we forget that R.S. did come out with a new radio
last year, a dualbander at thatbut it was taken off the market a week after
for reasns that it was too easily modifiable.Now you can be sure that if the
202 and the 404 have been cleared out and with the fact they tried a new
radio already that soon after the 202 is gone thier will definitely be a
replacement and something that will be a sucess like thier predecessors.So
in the meantime get off the PC`s and back on the airwaves and prove this CB
RAMBO piece of excrement that HAM RADIO is still alive and well. Don`t feed
the fire he`s trying to start and send him back to the bowels of the radio
spectrum.

Newsont wrote:
> I have a few questions;

> 1. Where can I get the computer interface cable?

Most places that sell software for it sell the cable as well. Some
have detailed instructions on how to build your own (which is what
I did way back before they were available).

> 2. Where can I get the software?

See my Software page:

http://www.strongsignals.net/htm/software.htm

> 3. Once I have the above what can I expect--what will the software do
for me? What are the advantages/disadvantages of having the
scanner
interfaced with a computer?

The biggest gains are the ability to remote program the radio. This
allows the radio to be reconfigured for any scanning interest. You
are no longer bound to the limited memory the radio came with. Along
with this goes the ability with most programs to be able to import
data you have gleaned from an FCC database search. Search 'em, find
'em, load 'em into the scanner. Click, click, click and you're done.
No more wearing out your fingertips or the keypad.

Other abilities include being able to make detailed logs of activity
as well as record audio to your computer hard drive and link the two
together to get a look-see at what happened while you were away.

Lastly, I use my BC895 running with Scancat to monitor several
800 MHz trunked agencies in my area. By doing so, I'm able to log
all traffic on these systems and find those trunking ids which are
infrequenctly used. Once targetted, I have a much better chance of
finding out who they are rather than having to sit by the radio all
the time and manually figure out which ids I have and which I don't.
Once the users are determined, I can program the software to display
an alpha-numeric string instead of seeing the trunking id. So instead
of seeing '8192', I see 'Police TAC 2'. The same goes for the
labeling of conventional frequencies as well.

Strong Signals,
Rich Wells N2MCA

Hello,

I found and undocumented keyboard trick on the Pro-26.

power up (plus) shift key (plus) digit 4

it anounces:

off SAVE or on SAVE

I saw somewhat similar at Bob Parnass for the BC3000xlt
(there is said Batery Save ON/OFF), but what could that mean?

Thanks

Tom van Ewijck
